APPLICATION INFORMATION

Figure 21.

$$E_g = R_T I_d + I_M \left(\frac{R_T}{K} - R_M \right) + V_{ref}$$

$$\left[1 + \frac{R_b}{R_s} + \frac{R_T}{R_s} \left(1 + \frac{1}{K} \right) \right]$$

R_s has to be adjusted so that the applied voltage V_M is suitable for a given motor, the speed is then linearly adjustable varying R_b .

The value R_T is calculated so that

$$R_T (\text{max.}) > K_{(\text{min.})} * R_M (\text{min.})$$

if $R_T (\text{max.}) > K * R_M$, instability may occur.

The values of C15 (4.7µF typ.) and C14 (1µF typ.) depend on the type of motor used. C15 adjusts WOW and flutter of the system. C14 suppresses motor spikes.
