16-Bit, Serial Input Multiplying Digital-to-Analog Converter

FEATURES

- ±0.5 LSB DNL
- 16-Bit Monotonic
- ±1 LSB INL
- Low Noise: 12 nV/√Hz
- Low Power: I_{DD} = 2 µA
- +2.7 V to +5.5 V Analog Power Supply
- 2 mA Full-Scale Current ±20%, with V_{REF} = 10 V
- 50-MHz Serial Interface
- 0.5 µs Settling Time
- 4-Quadrant Multiplying Reference
- Reference Bandwidth: 10 MHz
- ±10 V Reference Input
- Reference Dynamics: -105 THD
- Tiny 8-Lead 3 x 3 mm SON and 3 x 5 mm MSOP Packages
- Industry-Standard Pin Configuration

APPLICATIONS

- Automatic Test Equipment
- Instrumentation
- Digitally Controlled Calibration
- Industrial Control PLCs

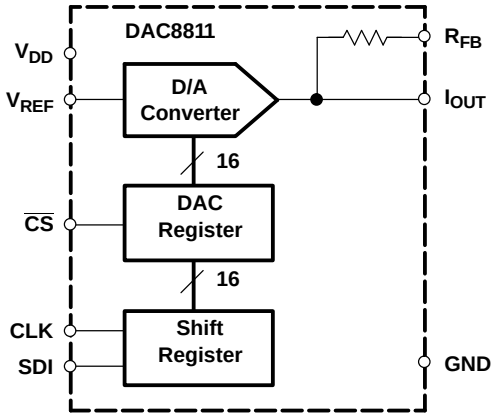
DESCRIPTION

The DAC8811 multiplying digital-to-analog converter (DAC) is designed to operate from a single 2.7-V to 5.5-V supply.

The applied external reference input voltage V_{REF} determines the full-scale output current. An internal feedback resistor (R_{FB}) provides temperature tracking for the full-scale output when combined with an external I-to-V precision amplifier.

A serial data interface offers high-speed, three-wire microcontroller-compatible inputs using data-in (SDI), clock (CLK), and chip-select ($\overline{CS}$).

The DAC8811 is packaged in space-saving 8-lead SON and MSOP packages.



This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

PACKAGE/ORDERING INFORMATION(1)

PRODUCT	MINIMUM RELATIVE ACCURACY (LSB)	DIFFERENTIAL NONLINEARITY (LSB)	PACKAGE-LEAD (DESIGNATOR)	SPECIFIED TEMPERATURE RANGE	PACKAGE MARKING	ORDERING NUMBER	TRANSPORT MEDIA, QUANTITY

ABSOLUTE MAXIMUM RATINGS

over operating free-air temperature range (unless otherwise noted)(1)

		DAC8811	UNIT
V_{DD} to GND		-0.3 to +7	V
Digital input voltage to GND		-0.3 to $+V_{DD}$ + 0.3	V
V (I_{OUT}) to GND		-0.3 to $+V_{DD}$ + 0.3	V
Operating temperature range		-40 to +105	°C
Storage temperature range		-65 to +150	°C
Junction temperature range (T_J max)		+125	°C
Power dissipation		(T_J max - T_A) / $R_{\Theta JA}$	
Thermal impedance, $R_{\Theta JA}$		55	°C/W
Lead temperature, soldering	Vapor phase (60s)	215	°C
Lead temperature, soldering	Infrared (15s)	220	°C
ESD rating, HBM		1500	V
ESD rating, CDM		1000	V

(1) Stresses above those listed under absolute maximum ratings may cause permanent damage to the device. Exposure to absolute maximum conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS

V_{DD} = +2.7 V to +5.5 V; I_{OUT} = Virtual GND, GND = 0 V; V_{REF} = 10 V; T_A = full operating temperature. All specifications -40°C to +85°C, unless otherwise noted.

Table 1. TERMINAL FUNCTIONS

PIN	NAME	DESCRIPTION
1	CLK	Clock input; positive edge triggered clocks data into shift register
2	SDI	Serial register input; data loads directly into the shift register MSB first. Extra leading bits are ignored.
3	R_{FB}	Internal matching feedback resistor. Connect to external op amp output.
4	V_{REF}	DAC reference input pin. Establishes DAC full-scale voltage. Constant input resistance versus code.
5	I_{OUT}	DAC current output. Connects to inverting terminal of external precision I/V op amp.
6	GND	Analog and digital ground.
7	V_{DD}	Positive power supply input. Specified operating range of 2.7 V to 5.5 V.
8	$\overline{CS}$	Chip-select; active low digital input. Transfers shift register data to DAC register on rising edge. See Table 2 for operation.

TYPICAL CHARACTERISTICS: V_{DD} = +5 V

At T_A = +25°C, $+V_{DD}$ = +5 V, unless otherwise noted.

THEORY OF OPERATION

The DAC8811 is a single channel current output, 16-bit digital-to-analog converter (DAC). The architecture, illustrated in Figure 17, is an R-2R ladder configuration with the three MSBs segmented. Each 2R leg of the ladder is either switched to GND or the I_{OUT} terminal. The I_{OUT} terminal of the DAC is held at a virtual GND potential by the use of an external I/V converter op amp. The R-2R ladder is connected to an external reference input V_{REF} that determines the DAC full-scale current. The R-2R ladder presents a code independent load impedance to the external reference of 5 kΩ± 25%. The external reference voltage can vary in a range of -15 V to 15 V, thus providing bipolar I_{OUT} current operation. By using an external I/V converter and the DAC8811 R_{FB} resistor, output voltage ranges of $-V_{REF}$ to V_{REF} can be generated.

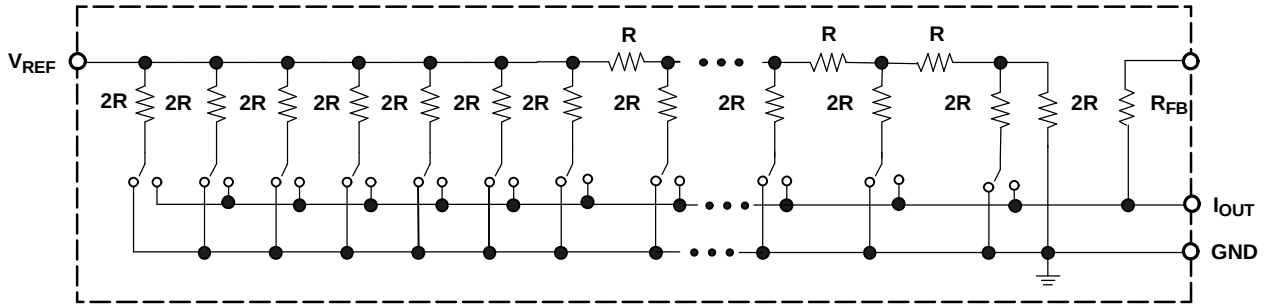

Figure 17. Equivalent R-2R DAC Circuit

When using an external I/V converter and the DAC8811 R_{FB} resistor, the DAC output voltage is given by Equation 1:

$$V_{OUT} = -V_{REF} \times \frac{CODE}{65536} \quad (1)$$

Each DAC code determines the 2R leg switch position to either GND or I_{OUT}. Because the DAC output impedance as seen looking into the I_{OUT} terminal changes versus code, the external I/V converter noise gain will also change. Because of this, the external I/V converter op amp must have a sufficiently low offset voltage such that the amplifier offset is not modulated by the DAC I_{OUT} terminal impedance change. External op amps with large offset voltages can produce INL errors in the transfer function of the DAC8811 due to offset modulation versus DAC code. For best linearity performance of the DAC8811, an op amp (OPA277) is recommended (Figure 18). This circuit allows V_{REF} swinging from -10 V to +10 V.

APPLICATION INFORMATION

Stability Circuit

For a current-to-voltage design (see Figure 20), the DAC8811 current output (I_{OUT}) and the connection with the inverting node of the op amp should be as short as possible and according to correct PCB layout design. For each code change there is a step function. If the GBP of the op amp is limited and parasitic capacitance is excessive at the inverting node then gain peaking is possible. Therefore, for circuit stability, a compensation capacitor C1 (4 pF to 20 pF typ) can be added to the design, as shown in Figure 20.

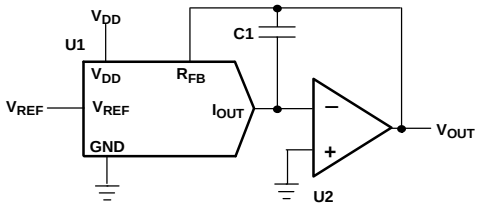

Figure 20. Gain Peaking Prevention Circuit With Compensation Capacitor

Positive Voltage Output Circuit

As Figure 21 illustrates, in order to generate a positive voltage output, a negative reference is input to the DAC8811. This design is suggested instead of using an inverting amp to invert the output due to tolerance errors of the resistor. For a negative reference, V_{OUT} and GND of the reference are level-shifted to a virtual ground and a -2.5 V input to the DAC8811 with an op amp.

APPLICATION INFORMATION (continued)

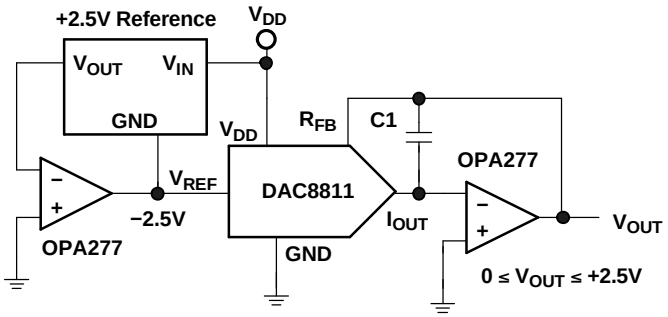

Figure 21. Positive Voltage Output Circuit

Bipolar Output Circuit

The DAC8811, as a 2-quadrant multiplying DAC, can be used to generate a unipolar output. The polarity of the full-scale output I_{OUT} is the inverse of the input reference voltage at V_{REF}.

Some applications require full 4-quadrant multiplying capabilities or bipolar output swing. As shown in Figure 22, external op amp U4 is added as a summing amp and has a gain of 2X that widens the output span to 5 V. A 4-quadrant multiplying circuit is implemented by using a 2.5-V offset of the reference voltage to bias U4. According to the circuit transfer equation given in Equation 2, input data (D) from code 0 to full scale produces output voltages of V_{OUT} = -2.5 V to V_{OUT} = +2.5 V.

$$V_{OUT} = \left(\frac{D}{32,768} - 1\right) \times V_{REF} \tag{2}$$

External resistance mismatching is the significant error in Figure 22.

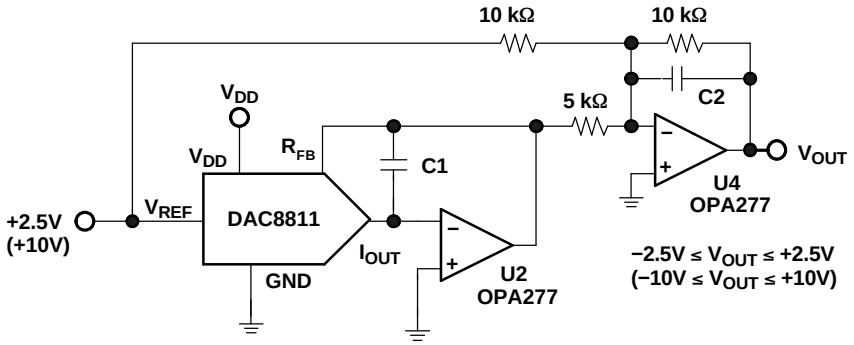

Figure 22. Bipolar Output Circuit

Programmable Current Source Circuit

A DAC8811 can be integrated into the circuit in Figure 23 to implement an improved Howland current pump for precise voltage to current conversions. Bidirectional current flow and high voltage compliance are two features of the circuit. With a matched resistor network, the load current of the circuit is shown by Equation 3:

$$I_L = \frac{(R2 + R3) \,/\, R1}{R3} \times V_{REF} \times D \tag{3}$$

The value of R3 in the previous equation can be reduced to increase the output current drive of U3. U3 can drive ±20 mA in both directions with voltage compliance limited up to 15 V by the U3 voltage supply. Elimination of the circuit compensation capacitor C1 in the circuit is not suggested as a result of the change in the output impedance Z_O, according to Equation 4:

$$Z_O = \frac{R1'R3(R1+R2)}{R1(R2'+R3') - R1'(R2+R3)} \quad (4)$$

As shown in Equation 4, with matched resistors, Z_O is infinite and the circuit is optimum for use as a current source. However, if unmatched resistors are used, Z_O is positive or negative with negative output impedance being a potential cause of oscillation. Therefore, by incorporating C1 into the circuit, possible oscillation problems are eliminated. The value of C1 can be determined for critical applications; for most applications, however, a value of several pF is suggested.

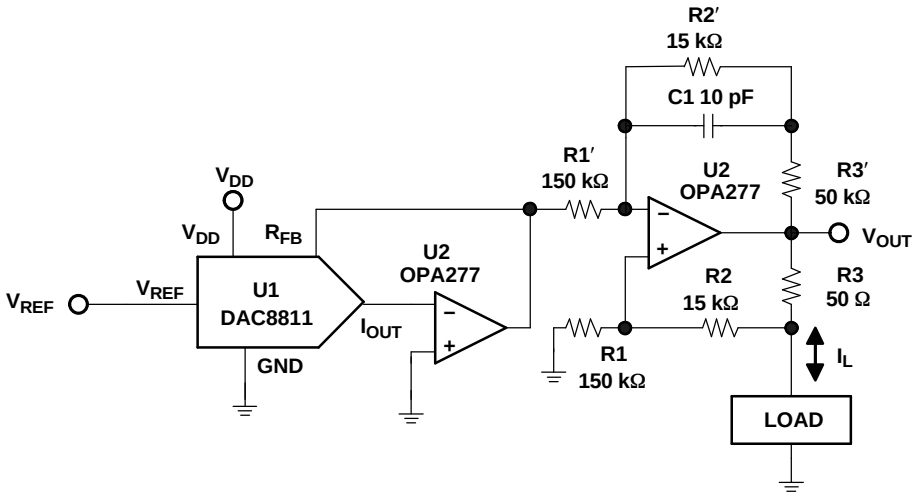

Figure 23. Programmable Bidirectional Current Source Circuit

Cross-Reference

The DAC8811 has an industry-standard pinout. Table 4 provides the cross-reference information.

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS) or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The Pb-Free/Green conversion plan has not been defined.
Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.
