Notes:

1. Unused inputs must be held high or low to prevent them from floating.
2. DC input signal voltage specifies the allowable DC execution of differential input.
3. Differential inputs signal voltages specifies the differential voltage [VTR-VCP] required for switching, where VT is the true input level and VCP is the complementary input level.
4. Differential cross-point voltage is expected to track variations of V_{DD} and is the voltage at which the differential signal must be crossing.

Phase error	$t_{(phase\ error)}^4$		-50	0	50	ps
Output to Output Skew	T_{skew}				60	ps

Notes:

1. Refers to transition on noninverting output in PLL bypass mode.
2. While the pulse skew is almost constant over frequency, the duty cycle error increases at higher frequencies. This is due to the formula: duty cycle= t_{WH}/t_c , where the cycle (t_c) decreases as the frequency goes up.
3. Switching characteristics guaranteed for application frequency range.
4. Static phase offset shifted by design.

Recommended Layout for the ICS95V850

General Layout Precautions:

Use copper flooded ground on the top signal layer under the clock buffer. The area under U1 on the right is an example. Flood over the ground vias.

- 1) Use power vias for power and ground. Vias 20 mil or larger in diameter have lower high frequency impedance. Vias for signals may be minimum drill size.
- 2) Make all power and ground traces are as wide as the via pad for lower inductance.
- 3) VAA for pin 16 has a low pass RC filter to decouple the digital and analog supplies. The 4.7uF capacitors may be replaced with a single low ESR device with the same total capacitance. VAA is routed on a outside signal layer. Do not cut a power or ground plane and route in it.
- 4) Notice that ground vias are never shared.
- 5) When ever possible, VCC (net V2P5 in the schematic) pins have a decoupling capacitor. Power is always routed from the plane connection via to the capacitor pad to the VCC pin on the clock buffer. Moats or plane cuts are not used to isolate power.
- 6) Differential mode clock output traces are routed:
 - a. With a ground trace between the pairs. Trace is grounded on both ends.
 - b. Without a ground trace, clock pairs are routed with a separation of at least 5 times the thickness of the dielectric. If the dielectric thickness is 4.5 mil, the trace separation is at least 18 mils.
- 7) Terminate differential CLK_IN and FB_IN traces after routing to buffer pads.
