DESCRIPTION

These high voltage, high current Darlington transistor arrays are comprised of seven silicon NPN Darlington pairs on a common monolithic substrate. All units feature open-collector outputs and integral suppression diodes for inductive loads. Peak in-rush currents to 600mA are allowable, making them ideal for driving tungsten filament lamps, also.

The Type ULN2003 has a series base resistor to each Darlington pair, and thus allows operation directly with TTL or CMOS 5V supply voltage.

The Type ULN2004 has an appropriate series input resistor to allow its operation directly from CMOS or PMOS outputs utilizing supply voltages of 6 to 15V. The required input current is below that of the Type ULN2003.

In all cases, the individual Darlington pair collector current rating is 500mA. However, outputs may be paralleled for higher load current capability. All devices are supplied in a 16-pin dual in-line plastic package.
