

3.3V 128K × 32/36 Flow Through Synchronous SRAM

Features

- Organization: 131,072 words × 32 or 36 bits
- Fast clock to data access: 6.5/7.5/8.0/10.0 ns
- Fast $\overline{OE}$ access time: 3.5/4.0 ns
- Fully synchronous flow through operation
- Asynchronous output enable control
- Available in 100-pin TQFP package
- Individual byte write and Global write
- Multiple chip enables for easy expansion
- 3.3V core power supply
- 2.5V or 3.3V I/O operation with separate V_{DDQ}
- Linear or interleaved burst control
- Snooze mode for reduced power standby
- Common data inputs and data outputs

Functional description

The AS7C33128FT32B/36B is a high-performance CMOS 4-Mbit synchronous Static Random Access Memory (SRAM) device organized as 131,072 words $\times$ 32 or 36 bits.

Fast cycle times of 7.5/8.5/10/12 ns with clock access times (t_{CD}) of 6.5/7.5/8.0/10 ns. Three chip enable ($\overline{CE}$) inputs permit easy memory expansion. Burst operation is initiated in one of two ways: the controller address strobe ($\overline{ADSC}$), or the processor address strobe ($\overline{ADSP}$). The burst advance pin ($\overline{ADV}$) allows subsequent internally generated burst addresses.

Read cycles are initiated with $\overline{ADSP}$ (regardless of $\overline{WE}$ and $\overline{ADSC}$) using the new external address clocked into the on-chip address register when $\overline{ADSP}$ is sampled low, the chip enables are sampled active, and the output buffer is enabled with $\overline{OE}$. In a read operation, the data accessed by the current address registered in the address registers by the positive edge of CLK are carried to the data-out buffer. $\overline{ADV}$ is ignored on the clock edge that samples $\overline{ADSP}$ asserted, but is sampled on all subsequent clock edges. Address is incremented internally for the next access of the burst when $\overline{ADV}$ is sampled low and both address strobes are high. Burst mode is selectable with the $\overline{LBO}$ input. With $\overline{LBO}$ unconnected or driven high, burst operations use an interleaved count sequence. With $\overline{LBO}$ driven low, the device uses a linear count sequence.

Write cycles are performed by disabling the output buffers with $\overline{OE}$ and asserting a write command. A global write enable $\overline{GWE}$ writes all 32/36 regardless of the state of individual $\overline{BW[a:d]}$ inputs. Alternately, when $\overline{GWE}$ is high, one or more bytes may be written by asserting $\overline{BWE}$ and the appropriate individual byte $\overline{BWn}$ signals.

$\overline{BWn}$ is ignored on the clock edge that samples $\overline{ADSP}$ low, but it is sampled on all subsequent clock edges. Output buffers are disabled when $\overline{BWn}$ is sampled LOW regardless of $\overline{OE}$. Data is clocked into the data input register when $\overline{BWn}$ is sampled low. Address is incremented internally to the next burst address if $\overline{BWn}$ and $\overline{ADV}$ are sampled low.

Read or write cycles may also be initiated with $\overline{ADSC}$ instead of $\overline{ADSP}$. The differences between cycles initiated with $\overline{ADSC}$ and $\overline{ADSP}$ are as follows:

- $\overline{ADSP}$ must be sampled high when $\overline{ADSC}$ is sampled low to initiate a cycle with $\overline{ADSC}$.
- $\overline{WE}$ signals are sampled on the clock edge that samples $\overline{ADSC}$ low (and $\overline{ADSP}$ high).
- Master chip enable $\overline{CE0}$ blocks $\overline{ADSP}$, but not $\overline{ADSC}$.

The AS7C33128FT32B and AS7C33128FT36B family operates from a core 3.3V power supply. I/Os use a separate power supply that can operate at 2.5V or 3.3V. These devices are available in a 100-pin TQFP package.

Signal descriptions

Pin	I/O	Properties	Description
CLK	I	CLOCK	Clock. All inputs except $\overline{OE}$, ZZ, and $\overline{LBO}$ are synchronous to this clock.
A,A0,A1	I	SYNC	Address. Sampled when all chip enables are active and when $\overline{ADSC}$ or $\overline{ADSP}$ are asserted.
DQ[a,b,c,d]	I/O	SYNC	Data. Driven as output when the chip is enabled and when $\overline{OE}$ is active.
$\overline{CE0}$	I	SYNC	Master chip enable. Sampled on clock edges when $\overline{ADSP}$ or $\overline{ADSC}$ is active. When $\overline{CE0}$ is inactive, $\overline{ADSP}$ is blocked. Refer to the “Synchronous truth table” for more information.
CE1, $\overline{CE2}$	I	SYNC	Synchronous chip enables, active high, and active low, respectively. Sampled on clock edges when $\overline{ADSC}$ is active or when $\overline{CE0}$ and $\overline{ADSP}$ are active.
$\overline{ADSP}$	I	SYNC	Address strobe processor. Asserted low to load a new address or to enter standby mode.
$\overline{ADSC}$	I	SYNC	Address strobe controller. Asserted low to load a new address or to enter standby mode.
$\overline{ADV}$	I	SYNC	Advance. Asserted low to continue burst read/write.
$\overline{GWE}$	I	SYNC	Global write enable. Asserted low to write all 32/36 bits. When high, $\overline{BWE}$ and $\overline{BW[a:d]}$ control write enable.
$\overline{BWE}$	I	SYNC	Byte write enable. Asserted low with $\overline{GWE}$ high to enable effect of $\overline{BW[a:d]}$ inputs.
$\overline{BW[a,b,c,d]}$	I	SYNC	Write enables. Used to control write of individual bytes when $\overline{GWE}$ is high and $\overline{BWE}$ is low. If any of $\overline{BW[a:d]}$ is active with $\overline{GWE}$ high and $\overline{BWE}$ low, the cycle is a write cycle. If all $\overline{BW[a:d]}$ are inactive, the cycle is a read cycle.
$\overline{OE}$	I	ASYNCR	Asynchronous output enable. I/O pins are driven when $\overline{OE}$ is active and chip is in read mode.
$\overline{LBO}$	I	STATIC	Selects Burst mode. When tied to V_{DD} or left floating, device follows interleaved Burst order. When driven Low, device follows linear Burst order. <i>This signal is internally pulled High.</i>
ZZ	I	ASYNCR	Snooze. Places device in low power mode; data is retained. Connect to GND if unused.
NC	-	-	No connect

Snooze Mode

SNOOZE MODE is a low current, power-down mode in which the device is deselected and current is reduced to I_{SB2} . The duration of SNOOZE MODE is dictated by the length of time the ZZ is in a High state.

The ZZ pin is an asynchronous, active high input that causes the device to enter SNOOZE MODE.

When the ZZ pin becomes a logic High, I_{SB2} is guaranteed after the time t_{ZZ1} is met. After entering SNOOZE MODE, all inputs except ZZ is disabled and all outputs go to High-Z. Any operation pending when entering SNOOZE MODE is not guaranteed to successfully complete. Therefore, SNOOZE MODE (READ or WRITE) must not be initiated until valid pending operations are completed. Similarly, when exiting SNOOZE MODE during t_{PUS} , only a DESELECT or READ cycle should be given while the SRAM is transitioning out of SNOOZE MODE.

Snooze mode	H	X	High-Z
Read	L	L	Dout
	L	H	High-Z
Write	L	X	Din, High-Z
Deselected	L	X	High-Z

Notes:

1. X means "Don't Care"
2. ZZ pin is pulled down internally
3. For write cycles that follows read cycles, the output buffers must be disabled with $\overline{\text{OE}}$, otherwise data bus contention will occur.
4. Snooze mode means power down state of which stand-by current does not depend on cycle times
5. Deselected means power down state of which stand-by current depends on cycle times

2 For $\overline{WRITE}$, L means any one or more byte write enable signals ($\overline{BWa}$, $\overline{BWb}$, $\overline{BWc}$ or $\overline{BWd}$) and $\overline{BWE}$ are LOW or $\overline{GWE}$ is LOW. $\overline{WRITE}$ = HIGH for all $\overline{BWx}$, $\overline{BWE}$, $\overline{GWE}$ HIGH. See "Write enable truth table (per byte)," on page 6 for more information.

3 For write operation following a READ, $\overline{OE}$ must be high before the input data set up time and held high throughout the input hold time

4 ZZ pin is always Low.

1	2	3	4	5	6	7	8	9	10

1. Alliance Semiconductor SRAM Prefix
2. Operating voltage: 33 = 3.3V
3. Organization: 128 = 128K
4. Flowthrough mode
5. Organization: 32 = X32; 36 = X36
6. Production version: B= product revision
7. Clock access time: [-65 = 6.5 ns; -75 = 7.5 ns; -80 = 8.0 ns; -10 = 10.0]
8. Package type: TQ = TQFP
9. Operating temperature: C = Commercial (0° C to 70° C); I = Industrial (-40° C to 85° C)
10. N = Lead free part
