16,777,216-BIT (1,048,576 -WORD BY 16-BIT) CMOS
3.3V-ONLY FLASH MEMORY &
4,194,304-BIT (262,144-WORD BY 16-BIT) CMOS SRAM
Stacked-CSP (Chip Scale Package)

DESCRIPTION

The MITSUBISHI M6MGB/T166S4BWG is a Stacked Chip Scale Package (S-CSP) that contents 16M-bits flash memory and 4M-bits Static RAM in a 72-pin S-CSP.

16M-bits Flash memory is a 1,048,576 words, 3.3V-only, and high performance non-volatile memory fabricated by CMOS technology for the peripheral circuit and DINOR(Divided bit-line NOR) architecture for the memory cell.

4M-bits SRAM is a 262,144words unsynchronous SRAM fabricated by silicon-gate CMOS technology.

M6MGB/T166S4BWG is suitable for the application of the mobile-communication-system to reduce both the mount space and weight .

FEATURES

- Access time

Flash Memory	90ns (Max.)
SRAM	85ns (Max.)
- Supply voltage

	Vcc=2.7 ~ 3.6V
--	----------------
- Ambient temperature

I version	Ta=-40 ~ 85°C
-----------	---------------
- Package : 72-pin S-CSP , 0.8mm ball pitch

APPLICATION

Mobile communication products

PIN CONFIGURATION (TOP VIEW)

BLOCK DIAGRAM

1. Flash Memory

DESCRIPTION

The Flash Memory of M6MGB/T166S4BWG is 3.3V-only high speed 16,777,216-bit CMOS boot block Flash Memories with alternating BGO (Back Ground Operation) feature. The BGO feature of the device allows Program or Erase operations to be performed in one bank while the device simultaneously allows Read operations to be performed on the other bank. This BGO feature is suitable for mobile and personal computing, and communication products. The Flash Memory of M6MGB/T166S4BWG is fabricated by CMOS technology for the peripheral circuits and DINOR(Divided bit line NOR) architecture for the memory cells.

FEATURES

- Organization1048,576 word x 16bit
- Supply voltage V_{CC} = 2.7~3.6V
- Access time 90ns (Max.)
- Power Dissipation
 - Read 54 mW (Max. at 5MHz)
 - (After Automatic Power Down) 0.33μW (typ.)
 - Program/Erase126 mW (Max.)
 - Standby 0.33μW (typ.)
 - Deep power down mode 0.33μW (typ.)
- Auto program for Bank(I)
 - Program Time4ms (typ.)
 - Program Unit
 - (Byte Program)1word
 - (Page Program)128word
- Auto program for Bank(II)
 - Program Time4ms (typ.)
 - Program Unit 128word
- Auto Erase
 - Erase time 40 ms (typ.)
 - Erase Unit
 - Bank(I) Boot Block 16Kword x 1
 - Parameter Block 16Kword x 7
 - Bank(II) Main Block 32Kword x 28
- Program/Erase cycles100Kcycles
- Boot Block
 - M6MGB166S4BWG Bottom Boot
 - M6MGT166S4BWG Top Boot
- Other Functions
 - Soft Ware Command Control
 - Selective Block Lock
 - Erase Suspend/Resume
 - Program Suspend/Resume
 - Status Register Read
 - Alternating Back Ground Program/Erase Operation
Between Bank(I) and Bank(II)
 - Auto Power Down Mode

Stacked-CSP (Chip Scale Package)

FUNCTION

The Flash Memory of M6MGB/T166S4BWG includes on-chip program/erase control circuitry. The Write State Machine (WSM) controls block erase and byte/page program operations. Operational modes are selected by the commands written to the Command User Interface (CUI). The Status Register indicates the status of the WSM and when the WSM successfully completes the desired program or block erase operation.

A Deep Powerdown mode is enabled when the F-RP# pin is at GND, minimizing power consumption.

Read

The Flash Memory of M6MGB/T166S4BWG has three read modes, which accesses to the memory array, the Device Identifier and the Status Register. The appropriate read command are required to be written to the CUI. Upon initial device powerup or after exit from deep powerdown, the Flash Memory automatically resets to read array mode. In the read array mode, low level input to F-CE# and F-OE#, high level input to F-WE# and F-RP#, and address signals to the address inputs (F-A19-F-A17,A16-A0) output the data of the addressed location to the data input/output (D15-D0).

Write

Writes to the CUI enables reading of memory array data, device identifiers and reading and clearing of the Status Register. They also enable block erase and program. The CUI is written by bringing F-WE# to low level, while F-CE# is at low level and F-OE# is at high level. Address and data are latched on the earlier rising edge of F-WE# and F-CE#. Standard micro-processor write timings are used.

Alternating Background Operation (BGO)

The Flash Memory of M6MGB/T166S4BWG allows to read array from one bank while the other bank operates in software command write cycling or the erasing / programming operation in the background. Read array operation with the other bank in BGO is performed by changing the bank address without any additional command. When the bank address points the bank in software command write cycling or the erasing / programming operation, the data is read out from the status register. The access time with BGO is the same as the normal read operation.

Output Disable

When F-OE# is at VIH, output from the devices is disabled. Data input/output are in a high-impedance(High-Z) state.

Standby

When F-CE# is at VIH, the device is in the standby mode and its power consumption is reduced. Data input/output are in a high-impedance(High-Z) state. If the memory is deselected during block erase or program, the internal control circuits remain active and the device consume normal active power until the operation completes.

Deep Power-Down

When F-RP# is at VIL, the device is in the deep powerdown mode and its power consumption is substantially low. During read modes, the memory is deselected and the data input/output are in a high-impedance(High-Z) state. After return from powerdown, the CUI is reset to Read Array, and the Status Register is cleared to value 80H.

During block erase or program modes, F-RP# low will abort either operation. Memory array data of the block being altered become invalid.

Automatic Power-Down (APD)

The Automatic Power-down minimizes the power consumption during read mode. The device automatically turns to this mode when any addresses or F-CE# isn't changed more than 200ns after the last alternation. The power consumption becomes the same as the stand-by mode. While in this mode, the output data is latched and can be read out. New data is read out correctly when addresses are changed.

Stacked-CSP (Chip Scale Package)

SOFTWARE COMMAND DEFINITIONS

The device operations are selected by writing specific software command into the Command User Interface.

Read Array Command (FFH)

The device is in Read Array mode on initial device power up and after exit from deep powerdown, or by writing FFH to the Command User Interface. After starting the internal operation the device is set to the read status register mode automatically.

Read Device Identifier Command (90H)

It can normally read device identifier codes when Read Device Identifier Code Command(90H) is written to the command latch. Following the command write, the manufacturer code and the device code can be read from address 00000H and 00001H, respectively.

Read Status Register Command (70H)

The Status Register is read after writing the Read Status Register command of 70H to the Command User Interface. Also, after starting the internal operation the device is set to the Read Status Register mode automatically.

The contents of Status Register are latched on the later falling edge of F-OE# or F-CE#. So F-CE# or F-OE# must be toggled every status read.

Clear Status Register Command (50H)

The Erase Status, Program Status and Block Status bits are set to "1"s by the Write State Machine and can only be reset by the Clear Status Register command of 50H. These bits indicates various failure conditions.

Block Erase / Confirm Command (20H/D0H)

Automated block erase is initiated by writing the Block Erase command of 20H followed by the Confirm command of D0H. An address within the block to be erased is required. The WSM executes iterative erase pulse application and erase verify operation.

Program Commands

A)Word Program (40H)

Word program is executed by a two-command sequence. The Word Program Setup command of 40H is written to the Command Interface, followed by a second write specifying the address and data to be written. The WSM controls the program pulse application and verify operation. The Word Program Command is valid for only Bank(I).

B)Page Program for Data Blocks (41H)

Page Program for Bank(I) and Bank(II) allows fast programming of 128words of data. Writing of 41H initiates the page program operation for the Data area. From 2nd cycle to 129th cycle, write data must be serially inputted. Address A6-A0 have to be incremented from 00H to 7FH. After completion of data loading, the WSM controls the program pulse application and verify operation.

C)Single Data Load to Page Buffer (74H) / Page Buffer to Flash (0EH/D0H)

Single data load to the page buffer is performed by writing 74H followed by a second write specifying the column address and data. Distinct data up to 128word can be loaded to the page buffer by this two-command sequence. On the other hand, all of the loaded data to the page buffer is programmed simultaneously by writing Page Buffer to Flash command of 0EH followed by the confirm command of D0H. After completion of programming the data on the page buffer is cleared automatically.

This command is valid for only Bank(I) alike Word Program.

Clear Page Buffer Command (55H)

Loaded data to the page buffer is cleared by writing the Clear Page Buffer command of 55H followed by the Confirm command of D0H. This command is valid for clearing data loaded by Single Data Load to Page Buffer command.

Suspend/Resume Command (B0H/D0H)

Writing the Suspend command of B0H during block erase operation interrupts the block erase operation and allows read out from another block of memory. Writing the Suspend command of B0H during program operation interrupts the program operation and allows read out from another block of memory. The Bank address is required when writing the Suspend/Resume Command. The device continues to output Status Register data when read, after the Suspend command is written to it. Polling the WSM Status and Suspend Status bits will determine when the erase operation or program operation has been suspended. At this point, writing of the Read Array command to the CUI enables reading data from blocks other than that which is suspended. When the Resume command of D0H is written to the CUI, the WSM will continue with the erase or program processes.

DATA PROTECTION

The Flash Memory of M6MGB/T166S4BWG provides selectable block locking of memory blocks. Each block has an associated nonvolatile lock-bit which determines the lock status of the block. In addition, the Flash Memory has a master Write Protect pin (F-WP#) which prevents any modifications to memory blocks whose lock-bits are set to "0", when F-WP# is low. When F-WP# is high, all blocks can be programmed or erased regardless of the state of the lock-bits, and the lock-bits are cleared to "1" by erase. See the BLOCK LOCKING table on P.9 for details.

Power Supply Voltage

When the power supply voltage (F-VCC) is less than V_{LKO} , Low Vcc Lock-Out voltage, the device is set to the Read-only mode. Regarding DC electrical characteristics of V_{LKO} , see P.10.

A delay time of 2 μ s is required before any device operation is initiated. The delay time is measured from the time F-Vcc reaches F-Vccmin (2.7V).

During power up, F-RP#=GND is recommended. Falling in Busy status is not recommended for possibility of damaging the device.

MEMORY ORGANIZATION

The Flash Memory of M6MGB/T166S4BWG has one 16Kword boot block, seven 16Kword parameter blocks, for Bank(I) and twenty-eight 32Kword main blocks for Bank(II). A block is erased independently of other blocks in the array.

1) Upper byte data (DQ8-DQ15) is ignored.

2) IA=ID Code Address : A0=VIL (Manufacturer's Code) : A0=VIH (Device Code), ID=ID Code

3) Bank = Bank Address (Bank(I) or Bank(II)) : F-A19-F-A17.

4) SRD = Status Register Data

5) Word Program, Single Data Load and Page Buffer to Flash Command is valid for only Bank(I).

6) WA = Write Address, WD = Write Data

7) WA0,WAn=Write Address, WD0,WDn=Write Data.

Write Address and Write Data must be provided sequentially from 00H to 7FH for A6-A0. Page size is 128word (128word x 16bit).

and also F-A19-F-A17,A16-A7(Block Address, Page Address) must be valid.

8) WA = Write Address : Upper page address, F-A19-F-A17,A16-A7(Block Address, Page Address) must be valid.

9) BA = Block Address : BA = Block Address : F-A19-F-A17,A16-A14(Bank1) F-A19-F-A17,A16-A15(Bank2)

10) DQ6 provides Block Lock Status, DQ6 = 1 : Block Unlock, DQ6 = 0 : Block Locked.

BLOCK LOCKING

		Lock Bit (Internally)	Write Protection Provided				Note
F-RP#	F-WP#		BANK(I)		BANK(II)	Lock Bit	
			Boot	Parameter	Data		
V _{IL}	X	X	Locked	Locked	Locked	Locked	Deep Power Down Mode
V _{IH}	V _{IL}	0	Locked	Locked	Locked	Locked	
		1	Locked	Unlocked	Unlocked	Locked	
	V _{IH}	X	Unlocked	Unlocked	Unlocked	Unlocked	All Blocks Unlocked

1) DQ6 provides Lock Status of each block after writing the Read Lock Status command (71H).

F-WP# pins must not be switched during performing Erase / Write operations or WSM Busy (WSMS = 0).

2) Erase/Write command for locked blocks is aborted. At this time read mode is not array read mode but status read mode and 00B0H is read. Please issue Clear Status Register command plus Read Array command to change the mode from status read mode to array read mode.

STATUS REGISTER

Symbol	Status	Definition	
		"1"	"0"
SR.7 (DQ7)	Write State Machine Status	Ready	Busy
SR.6 (DQ6)	Suspend Status	Suspended	Operation in Progress / Completed
SR.5 (DQ5)	Erase Status	Error	Successful
SR.4 (DQ4)	Program Status	Error	Successful
SR.3 (DQ3)	Block Status after Program	Error	Successful
SR.2 (DQ2)	<i>Reserved</i>	-	-
SR.1 (DQ1)	<i>Reserved</i>	-	-
SR.0 (DQ0)	<i>Reserved</i>	-	-

*The F-RY/BY# is an open drain output pin and indicates status of the internal WSM. When low, it indicates that the WSM is Busy performing an operation.

A pull-up resistor of 10K-100K Ohms is required to allow the F-RY/BY# signal to transition high indicating a Ready WSM condition.

*DQ3 indicates the block status after the page programming, word programming and page buffer to flash. When DQ3 is "1", the page has the over-programmed cell. If over-program occurs, the device is block fail. However if DQ3 is "1", please try the block erase to the block. The block may revive.

ABSOLUTE MAXIMUM RATINGS

Symbol	Parameter	Conditions	Min	Max	Unit
F-V _{CC}	Flash V _{CC} voltage	With respect to Ground	-0.2	4.6	V
V _{IL}	All input or output voltage ¹⁾		-0.6	4.6	V
T _a	Ambient temperature		-40	85	°C
T _{bs}	Temperature under bias		-50	95	°C
T _{stg}	Storage temperature		-65	125	°C
I _{OUT}	Output short circuit current			100	mA

1) Minimum DC voltage is -0.5V on input/output pins. During transitions, this level may undershoot to -2.0V for periods <20ns. Maximum DC voltage on input/output pins is (F-V_{CC})+0.5V which, during transitions, may overshoot to (F-V_{CC})+1.5V for periods <20ns.

CAPACITANCE

Symbol	Parameter	Test conditions	Limits			Unit
			Min	Typ	Max	
C _{IN}	Input capacitance (Address, Control Pins)	T _a = 25°C, f = 1MHz, V _{in} = V _{out} = 0V			8	pF
C _{OUT}	Output capacitance				12	pF

Note: The value of common pins to Flash Memory is the sum of Flash Memory and SRAM.

DC ELECTRICAL CHARACTERISTICS (T_a = -40~ 85°C, F-V_{CC} = 2.7V ~ 3.6V, unless otherwise noted)

Symbol	Parameter	Test conditions	Limits			Unit
			Min	Typ1)	Max

I _{CC3}	F-V _{CC} program current	F-V _{CC} = 3.6V, V _{IN} =V _{IL} /V _{IH} , F-CE# = F-RP# = F-WP# = V _{IH}			35	mA
I _{CC4}	F-V _{CC} erase current	F-V _{CC} = 3.6V, V _{IN} =V _{IL} /V _{IH} , F-CE# = F-RP# = F-WP# = V _{IH}			35	mA
I _{CC5}	F-V _{CC} suspend current	F-V _{CC} = 3.6V, V _{IN} =V _{IL} /V _{IH} , F-CE# = F-RP# = F-WP# = V _{IH}			200	μA
V _{IL}	Input low voltage		- 0.5		0.8	V
V _{IH}	Input high voltage		2.0		(F-V _{CC})+0.5	V
V _{OL}	Output low voltage	I _{OL} = 4.0mA			0.45	V
V _{OH1}	Output high voltage	I _{OH} = -2.0mA	0.85X(F-V _{CC})			V
V _{OH2}		I _{OH} = -100μA	(F-V _{CC})-0.4			V
V _{LKO}	Low V _{CC} Lock-Out voltage 2)		1.5		2.2	V

All currents are in RMS unless otherwise noted.

1) Typical values at F-V_{CC}=3.3V, T_a=25°C

2) To protect against initiation of write cycle during F-V_{CC} power-up/ down, a write cycle is locked out for F-V_{CC} less than V_{LKO}.

If F-V_{CC} is less than V_{LKO}, Write State Machine is reset to read mode. When the Write State Machine is in Busy state, if F-V_{CC} is less than V_{LKO}, the alteration of memory contents may occur.

Vcc Power Up / Down Timing

Symbol	Parameter	Min	Typ	Max	Unit
tVCS	F-RP# =VIH set-up time from Vccmin	2			μs

Please see page 13.

During power up/down, by the noise pulses on control pins, the device has possibility of accidental erasure or programming.

The device must be protected against initiation of write cycle for memory contents during power up/down.

The delay time of min.2μsec is always required before read operation or write operation is initiated from the time F-Vcc reaches F-Vccmin during power up/down.

By holding F-RP# VIL, the contents of memory is protected during F-Vcc power up/down.

During power up, F-RP# must be held VIL for min.2μs from the time F-Vcc reaches F-Vccmin.

During power down, F-RP# must be held VIL until Vcc reaches GND.

F-RP# doesn't have latch mode ,therefore F-RP# must be held VIH during read operation or erase/program operation.

Read/Standby State

- Read Status Register**: Interacts with **Read Device Identifier** (70H, 90H), **Read Lock Status** (70H, 71H), and **Read Array** (70H, 71H, FFH).
- Read Device Identifier**: Interacts with **Read Status Register** (70H, 90H) and **Read Array** (90H, FFH).
- Read Lock Status**: Interacts with **Read Status Register** (70H, 71H) and **Read Array** (71H, FFH).
- Read Array**: Interacts with **Read Status Register** (70H, 71H, FFH) and **Read Array (From The Other Bank)** (Change Bank Address).
- Clear Status Register**: Triggered by 50H.

Setup State

- Clear Page Buffer Setup**: Triggered by 55H.
- Single Data Load to Page Buffer Setup**: Triggered by 74H.
- Page Buffer to Flash Setup**: Triggered by 0EH.
- Page Program Setup**: Triggered by 41H.
- Word Program Setup**: Triggered by 40H.
- Lock Bit Program Setup**: Triggered by 77H.
- Block Erase Setup**: Triggered by 20H.
- Erase All Unlocked Blocks Setup**: Triggered by A7H.

Internal State

- Program & Verify**: Includes a **Read Status Register**. Receives data (D0H) and program/verify data (WD, WD_i i=0-127). Outputs D0H, B0H, and B0H.
- Erase & Verify**: Includes a **Read Status Register**. Receives data (D0H) and erase/verify data (OTHER, D0H). Outputs D0H.

Suspend State

- Read Status Register**: Interacts with **Read Array** (70H, FFH).
- Read Array**: Interacts with **Read Status Register** (70H, FFH).

Read State with BGO

- Read Array (From The Other Bank)**: Interacts with **Read Array** (Change Bank Address).

Transitions and Signals

- Change Bank Address**: Signal used to switch between banks.
- Ready**: Signal indicating the device is ready for a new command.
- Other**: Labeled as 'OTHER' in the diagram, representing various control signals.

2. SRAM

The SRAM of M6MGB/T166S4BWG is organized as 262,144-word by 16-bit. These devices operate on a single +2.7~3.6V powersupply, and are directly TTL compatible to both input and output. Its fully static circuit needs no clocks and no refresh, and makes it useful.

The operation mode are determined by a combination of the device control inputs , S-LB#,S-UB#,S-CE1#,S-CE2, S-WE# and S-OE#. Each mode is summarized in the function table.

A write operation is executed whenever the low level S-WE# overlaps with the low level S-LB# and/or S-UB# and the low level S-CE1#the high level S-CE2. The address A0~A16,SA-17 must be set up before the write cycle and must be stable during the entire cycle.

A read operation is executed by setting S-WE# at a high level and S-OE# at a low level while S-LB# and/or S-UB# and S-CE1# and S-CE2 are in an active state(S-CE1#=L,S-CE2=H).

When setting S-LB# at the high level and other pins are in an active stage, upper-byte are in selectable mode in which both reading and writing are enabled, and lower-byte are in non-selectable mode. And when setting S-UB# at a high level and other pins are in an active stage, lower-byte are in a selectable mode and upper-byte are in a non-selectable mode.

When setting S-LB# and S-UB# at a high level or S-CE1# at high level or S-CE2 at a low level, the chips are in a non-selectable mode in which both reading and writing are disabled. In this mode, the output stage is in a high-impedance state, allowing OR-tie with other chips and memory expansion by S-LB#,S-UB# and S-CE1#,S-CE2.

The power supply current is reduced as low as 0.3μA(25°C,typical), and the memory data can be held at +2V powersupply, enabling battery back-up operation during power failure or power-down operation in the non-selected mode.

FUNCTION TABLE

			Min	Typ	Max	
C _I	Input capacitance	V _I =GND, V _I =25mVrms, f=1MHz			10	pF
C _O	Output capacitance	V _O =GND, V _O =25mVrms, f=1MHz			10	

Note: The value of common pins to SRAM is the sum of Flash Memory and SRAM.

AC ELECTRICAL CHARACTERISTICS

(S-Vcc=2.7 ~ 3.6V, unless otherwise noted)

(1) TEST CONDITIONS

Supply voltage	2.7V~3.6V
Input pulse	$V_{IH}=2.4V$, $V_{IL}=0.4V$
Input rise time and fall time	5ns
Reference level	$V_{OH}=V_{OL}=1.5V$ Transition is measured $\pm 500mV$ from steady state voltage.(for t_{en} , t_{dis})
Output loads	Fig.1, $CL=30pF$ $CL=5pF$ (for t_{en} , t_{dis})

Fig.1 Output load

(2) READ CYCLE

Symbol	Parameter	Limits		Units
		SRAM		
		Min	Max	
t _{CR}	Read cycle time	85		ns
t _a (A)	Address access time		85	ns
t _a (CE1)	Chip select 1 access time		85	ns
t _a (CE2)	Chip select 2 access time		85	ns
t _a (LB)	Lower Byte control access time		85	ns
t _a (UB)	Upper Byte control access time		85	ns
t _a (OE)	Output enable access time		45	ns
t _{dis} (CE1)	Output disable time after S-CE1# high		30	ns
t _{dis} (CE2)	Output disable time after S-CE2 low		30	ns
t _{dis} (LB)	Output disable time after S-LB# high		30	ns
t _{dis} (UB)	Output disable time after S-UB# high		30	ns
t _{dis} (OE)	Output disable time after S-OE high		30	ns
t _{en} (CE1)	Output enable time after S-CE1# low	10		ns
t _{en} (CE2)	Output enable time after S-CE2 high	10		ns
t _{dis} (LB)	Output enable time after S-LB# low	10		ns
t _{dis} (UB)	Output enable time after S-UB# low	10		ns
t _{en} (OE)	Output enable time after S-OE low	5		ns
t _v (A)	Data valid time after address	10		ns

(3) WRITE CYCLE

Symbol	Parameter	Limits		Units
		SRAM		
		Min	Max	
t _{cw}	Write cycle time	85		ns
t _w (W)	Write pulse width	50		ns
t _{su} (A)	Address setup time	0		ns
t _{su} (A-WH)	Address setup time with respect to S-WE#	70		ns
t _{su} (LB)	Lower Byte control setup time	70		ns
t _{su} (UB)	Upper Byte control setup time	70		ns
t _{su} (CE1)	Chip select 1 setup time	70		ns
t _{su} (CE2)	Chip select 2 setup time	70		ns
t _{su} (D)	Data setup time	35		ns
t _h (D)	Data hold time	0		ns
t _{rec} (W)	Write recovery time	0		ns
t _{dis} (W)	Output disable time from S-WE# low		30	ns
t _{dis} (OE)	Output disable time from S-OE# high		30	ns
t _{en} (W)	Output enable time from S-WE# high	5		ns
t _{en} (OE)	Output enable time from S-OE# low	5		ns

Stacked-CSP (Chip Scale Package)

Write cycle (S-LB#,S-UB# control mode)

Note 3: Hatching indicates the state is "don't care".

Note 4: A Write occurs during S-CE1# low, S-CE2 high overlaps S-LB# and/or S-UB# low and W low.

Note 5: When the falling edge of S-WE# is simultaneously or prior to the falling edge of S-LB# and/or S-UB# or the falling edge of S-CE1# or rising edge of S-CE2, the outputs are maintained in the high impedance state.

Note 6: Don't apply inverted phase signal externally when DQ pin is in output mode.

POWER DOWN CHARACTERISTICS

(1) ELECTRICAL CHARACTERISTICS

Symbol	Parameter	Test conditions			Limits			Units
					Min	Typ	Max	
S-Vcc (PD)	Power down supply voltage				2.0			V
VI (S-BC)	Byte control input S-LB#,S-UB#				2.0			V
VI (S-CE1#)	Chip select input S-CE1#				2.0			V
VI (S-CE2)	Chip select input S-CE2						0.2	V
Icc (PD)	Power down supply current	S-Vcc=3.0V S-CE2≤0.2V other inputs=0~3V	-I	+70 ~ +85 °C	-	-	30	μA
				+40 ~ +70 °C	-	-	15	
				+25 ~ +40 °C	-	1	3	
				- 40 ~ +25 °C	-	0.3	1	

Typical value is for Ta=25°C

(2) TIMING REQUIREMENTS

Symbol	Parameter	Test conditions	Limits			Units
			Min	Typ	Max	
t _{su} (PD)	Power down set up time		0			ns
t _{rec} (PD)	Power down recovery time		5			ms
