Description

The Hitachi HM5116100 is a CMOS dynamic RAM organized 16,777,216-word $\times$ 1-bit. It employs the most advanced 0.5 μ m CMOS technology for high performance and low power. The HM5116100 offers Fast Page Mode as a high speed access mode. It is packaged in 26-pin plastic SOJ.

Features

- Single 5 V ($\pm 10\%$)
- Access time: 50 ns/60 ns/70 ns (max)
- Power dissipation
 - Active mode: 495 mW/440 mW/385 mW (max)
 - Standby mode 11 mW (max)
- Fast page mode capability
- Refresh cycles
 - 4096 refresh cycles : 64 ms
- 3 variations of refresh
 - $\overline{\text{RAS}}$ -only refresh
 - $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$ refresh
 - Hidden refresh
- Test function
 - 16-bit parallel test mode

Refresh Cycle

Parameter	Symbol	Max	Unit	Note
Refresh period	t _{REF}	64	ms	4096 cycles

Notes: 1. AC measurements assume $t_T = 5$ ns.

2. An initial pause of 200 μ s is required after power up followed by a minimum of eight initialization cycles (any combination of cycles containing RAS-only refresh or CAS-before-RAS refresh). If the internal refresh counter is used, a minimum of eight $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$ refresh cycles are required.
3. Operation with the t_{RCD} (max) limit insures that t_{RAC} (max) can be met, t_{RCD} (max) is specified as a reference point only; if t_{RCD} is greater than the specified t_{RCD} (max) limit, then access time is controlled exclusively by t_{CAC} .
4. Operation with the t_{RAD} (max) limit insures that t_{RAC} (max) can be met, t_{RAD} (max) is specified as a reference point only; if t_{RAD} is greater than the specified t_{RAD} (max) limit, then access time is controlled exclusively by t_{AA} .
5. V_{IH} (min) and V_{IL} (max) are reference levels for measuring timing of input signals. Also, transition times are measured between V_{IH} (min) and V_{IL} (max).
6. Assume that $t_{\text{RCD}} \leq t_{\text{RCD}}$ (max) and $t_{\text{RAD}} \leq t_{\text{RAD}}$ (max). If t_{RCD} or t_{RAD} is greater than the maximum recommended value shown in this table, t_{RAC} exceeds the value shown.
7. Measured with a load circuit equivalent to 2 TTL loads and 100 pF.
8. Assume that $t_{\text{RCD}} \geq t_{\text{RCD}}$ (max) and $t_{\text{RAD}} \leq t_{\text{RAD}}$ (max).
9. Assume that $t_{\text{RCD}} \leq t_{\text{RCD}}$ (max) and $t_{\text{RAD}} \geq t_{\text{RAD}}$ (max).
10. Either t_{RCH} or t_{RRH} must be satisfied for a read cycles.
11. t_{OFF} (max) and t_{OEZ} (max) define the time at which the outputs achieve the open circuit condition and are not referred to output voltage levels.
12. t_{WCS} , t_{RWD} , t_{CWD} , t_{AWD} and t_{CPW} are not restrictive operating parameters. They are included in the data sheet as electrical characteristics only; if $t_{\text{WCS}} \geq t_{\text{WCS}}$ (min), the cycle is an early write cycle and the data out pin will remain open circuit (high impedance) throughout the entire cycle; if $t_{\text{RWD}} \geq t_{\text{RWD}}$ (min), $t_{\text{CWD}} \geq t_{\text{CWD}}$ (min), and $t_{\text{AWD}} \geq t_{\text{AWD}}$ (min), or $t_{\text{CWD}} \geq t_{\text{CWD}}$ (min), $t_{\text{AWD}} \geq t_{\text{AWD}}$ (min) and $t_{\text{CPW}} \geq t_{\text{CPW}}$ (min), the cycle is a read-modify-write and the data output will contain data read from the selected cell; if neither of the above sets of conditions is satisfied, the condition of the data out (at access time) is indeterminate.
13. These parameters are referenced to $\overline{\text{CAS}}$ leading edge in early write cycles and to $\overline{\text{WE}}$ leading edge in delayed write or read-modify-write cycles.
14. t_{RASP} defines $\overline{\text{RAS}}$ pulse width in fast page mode cycles.
15. Access time is determined by the longest among t_{AA} , t_{CAC} and t_{CPA} .
16. The 16M DRAM offers a 16-bit time saving parallel test mode. Address CA0, CA1, CA10 and CA11 for the $16\text{M} \times 1$ are don't care during test mode. Test mode is set by performing a $\overline{\text{WE}}$ -and- $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$ (WCBR) cycle. In 16-bit parallel test mode, data is written into 16 bits in parallel at Din and read out from Dout.
If 16 bits are equal (all 1s or 0s), data output pin is a high state during test mode read cycle, then the device has passed. If they are not equal, data output pin is a low state, then the device has failed. Refresh during test mode operation can be performed by normal read cycles or by WCBR refresh cycles.
To get out of test mode and enter a normal operation mode, perform either a regular $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$ refresh cycle or $\overline{\text{RAS}}$ -only refresh cycle.
17. In a test mode read cycle, the value of t_{RAC} , t_{AA} , t_{CAC} and t_{CPA} is delayed by 2 ns to 5 ns for the specified value. These parameters should be specified in test mode cycles by adding the above value to the specified value in this data sheet.
18. XXX: H or L (H: V_{IH} (min) $\leq V_{\text{IN}} \leq V_{\text{IH}}$ (max), L: V_{IL} (min) $\leq V_{\text{IN}} \leq V_{\text{IL}}$ (max))
