- Note:
1. Transition is measured ± 200 mV from steady voltage with Load (B). This parameter is sampled and not 100% tested.
 2. Address should be valid prior to or coincident with $\overline{CS}$ transition low.
 3. $\overline{WE}$ and/or $\overline{CS}$ must be high during address transition time.
 4. If $\overline{CS}$ and $\overline{OE}$ are low during this period, I/O pins are in the output state. Then, the data input signals of opposite phase to the outputs must not be applied to them.
 5. If the $\overline{CS}$ low transition occurs simultaneously with the $\overline{WE}$ low transition or after the $\overline{WE}$ transition, output remains a high impedance state.
 6. t_{AS} is measured from the latest address transition to the later of $\overline{CS}$ or $\overline{WE}$ going low.
 7. t_{WR} is measured from the earlier of $\overline{CS}$ or $\overline{WE}$ going high to the first address transition.
 8. A write occurs during the overlap of a low $\overline{CS}$ and a low $\overline{WE}$. A write begins at the latest transition among $\overline{CS}$ going low and $\overline{WE}$ going low. A write ends at the earliest transition among $\overline{CS}$ going high and $\overline{WE}$ going high. t_{WP} is measured from the beginning of write to the end of write.
 9. t_{CW} is measured from the later of $\overline{CS}$ going low to the the end of write.
