SP8629

150MHz ÷ 100

The SP8629 is an ECL counter which provides a TTL compatible output, high input sensitivity and low power consumption. Pin compatible with DM8629, it features a much lower power consumption.

FEATURES

- TTL/CMOS Compatible Output
- High Input Sensitivity
- Ideal Frequency Counter Prescaler
- On Chip Zener Diode

Fig.1 Pin connections - top view

QUICK REFERENCE DATA

- Supply Voltage: 5V
- Power Consumption: 170mW
- Temperature Range: -40°C to +85°C

ABSOLUTE MAXIMUM RATINGS

Supply voltage (Pins 1 and 8)	8V
Output current	40mA
Storage temperature range	-55°C to +125°C
Max. junction temperature	+175°C
Max. clock I/P voltage	2.5V p-p

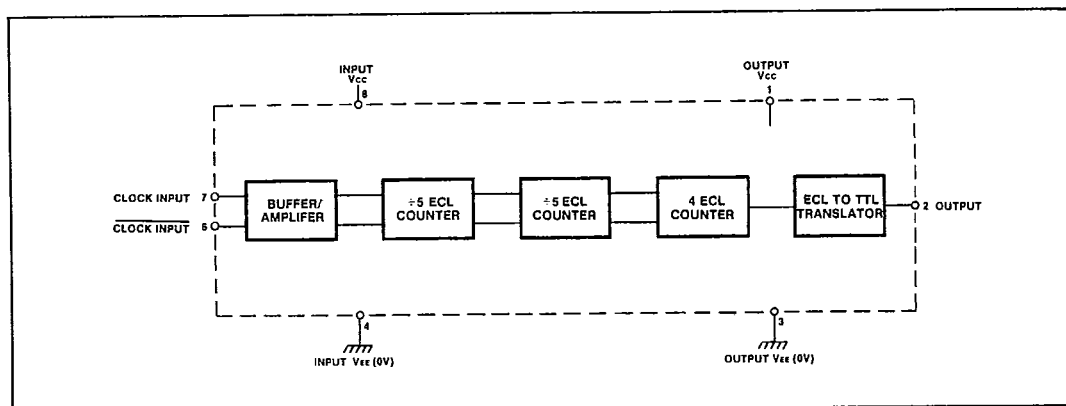

Fig.2 SP8629 logic diagram

ELECTRICAL CHARACTERISTICS

Supply Voltage: $V_{CC} = 5.2V \pm 0.52V$ $V_{EE} = 0V$
 Temperature: $T_{amb} -40^{\circ}C$ to $+85^{\circ}C$

T-45-19-05

Characteristics	Symbol	Value		Units	Conditions
		Min.	Max.		
Maximum toggle frequency sinewave input	f_{max}	150		MHz	Input = 200-1000mV p-p
Minimum toggle frequency sinewave input	f_{min}		10	MHz	Input = 600-1000mV p-p
Power supply current	I_{EE}		45	mA	
Output high voltage	V_{OH}	2.4		V	$V_{CC} = 4.68V$ $I_{OH} = -400\mu A$
Output high voltage	V_{OH}	2.0		V	$V_{CC} = 4.68V$ $I_{OH} = -1.6mA$
Output low voltage	V_{OL}		0.5	V	$V_{CC} = 5.72V$ $I_{OL} = 8mA$
Output short circuit current	I_{OS}	-10	-40	mA	$V_{CC} = 5.72V$
Internal zener voltage	V_Z	5.85	6.65	V	

NOTES

1. Unless otherwise stated the electrical characteristics shown above are guaranteed over specified supply, frequency and temperature range.
2. The dynamic test circuit is shown in Fig.5.
3. All characteristics above are tested at $25^{\circ}C$ only.

* Tested as
specified in
table of
Electrical
Characteristics

OPERATING NOTES

1. Two V_{EE} and two V_{CC} connections are provided, separating the ECL stages from the TTL section, isolating the noise transients inherent in the TTL structure. In most cases, shorting the two V_{EE} pins to a good ground plane and the V_{CC} pins to a wide V_{CC} bus will provide sufficient isolation. All components used in the circuit layout should be suitable for the frequencies involved and leads should be kept short to minimise stray inductance.
2. The signal source is usually capacitively coupled to the input as shown in Fig. 6. In the single-ended mode a capacitor of $0.01\mu F$ (C_2) should be connected between the unused input and the ground plane to provide a good high frequency bypass. The capacitor should be increased at lower frequencies. If the input is likely to be interrupted, it may be desirable to connect a $100k$ resistor between an input and ground.
3. In the single ended mode it is preferable to connect the resistor to the unused input. The addition of the $100k$ resistor causes a loss of input sensitivity, but prevents circuit

oscillations under no signal (open circuit) conditions.

4. The input waveform will normally be sinusoidal but below $10MHz$ correct operation depends on the slew rate of the input signal. A slew rate of $50V/\mu s$ will enable the device to operate down to DC. The device will operate with a TTL input signal as shown in Fig. 7 and is DC coupled to the input.

The device can be used in phase locked loop applications such as FM radio or other communications bands to prescale the input frequency down to a more useable level. A digital frequency display system can also be derived separately or in conjunction with a phase locked loop, and it can extend the useful range of many inexpensive frequency counters to, typically, $200MHz$.

5. The on-chip Zener diode allows a simple stabilised power supply to be constructed with the addition of a few extra external components, as shown in Fig. 8, to the SP8629.

6. The INPUT is positive edge triggered while the INPUT triggers on the negative edge.
