Description/Applications

The TX-2835 is an epitaxial, planar passivated diode whose construction utilizes a metal-to-silicon junction. This results in extremely low forward voltage drops and ultra high speed switching, for applications that require high reliability screening.

The low forward voltage drop, combined with fast switching and high temperature capability, makes these devices attractive as replacements for germanium and silicon P/N junction diodes in such applications as low level switching, clamping, sampling, reference circuits, and low noise UHF mixers.

The uniformity of forward characteristics with current over the temperature range also makes these units suitable for circuitry requiring tight matching of characteristics.

High Reliability Program

Three basic levels of High-Rel testing are offered

1. The TX prefix indicates a part that is preconditioned and screened to the program shown in Table III and IV
2. The TXB prefix identifies a part that is preconditioned and screened to TX level with a Group B quality conformance test as shown in Table V.
3. The TXV and TXVB prefix indicates that an internal visual inspection per MIL-STD-750 Method 2074 is included as part of the preconditioning and screening

From these three basic levels, four combinations are available. Please refer to Table II as a guide.

TABLE II. PART NUMBER SYSTEM FOR ORDER AND RFQ INFORMATION
