

## 32K x 32 3.3V Synchronous SRAM Flow-Through Outputs

IDT71V433

### Features

- ◆ 32K x 32 memory configuration
- ◆ Supports high performance system speed:  
*Commercial and Industrial:*
  - 11 11ns Clock-to-Data Access (50MHz)
  - 12 12ns Clock-to-Data Access (50MHz)
- ◆ LBO input selects interleaved or linear burst mode
- ◆ Self-timed write cycle with global write control (GW), byte write enable (BWE), and byte writes (BWx)
- ◆ Power down controlled by ZZ input
- ◆ Single 3.3V power supply (+10/-5%)
- ◆ Packaged in a JEDEC Standard 100-pin rectangular plastic thin quad flatpack (TQFP).

### Description

The IDT71V433 is a 3.3V high-speed 1,048,576-bit SRAM organized as 32K x 32 with full support of various processor interfaces including the Pentium™ and PowerPC™. The flow-through burst architecture provides cost-effective 2-1-1-1 performance for processors up to 50 MHz.

The IDT71V433 SRAM contains write, data-input, address and control registers. There are no registers in the data output path (flow-through architecture). Internal logic allows the SRAM to generate a self-timed write based upon a decision which can be left until the extreme end of the write cycle.

The burst mode feature offers the highest level of performance to the system designer, as the IDT71V433 can provide four cycles of data for a single address presented to the SRAM. An internal burst address counter accepts the first cycle address from the processor, initiating the access sequence. The first cycle of output data will flow-through from the array after a clock-to-data access time delay from the rising clock edge of the same cycle. If burst mode operation is selected (ADV=LOW), the subsequent three cycles of output data will be available to the user on the next three rising clock edges. The order of these three addresses will be defined by the internal burst counter and the LBO input pin.

The IDT71V433 SRAM utilizes IDT's high-performance 3.3V CMOS process, and is packaged in a JEDEC Standard 14mm x 20mm 100-pin thin plastic quad flatpack (TQFP).

### Pin Description

## Pin Definitions<sup>(1)</sup>

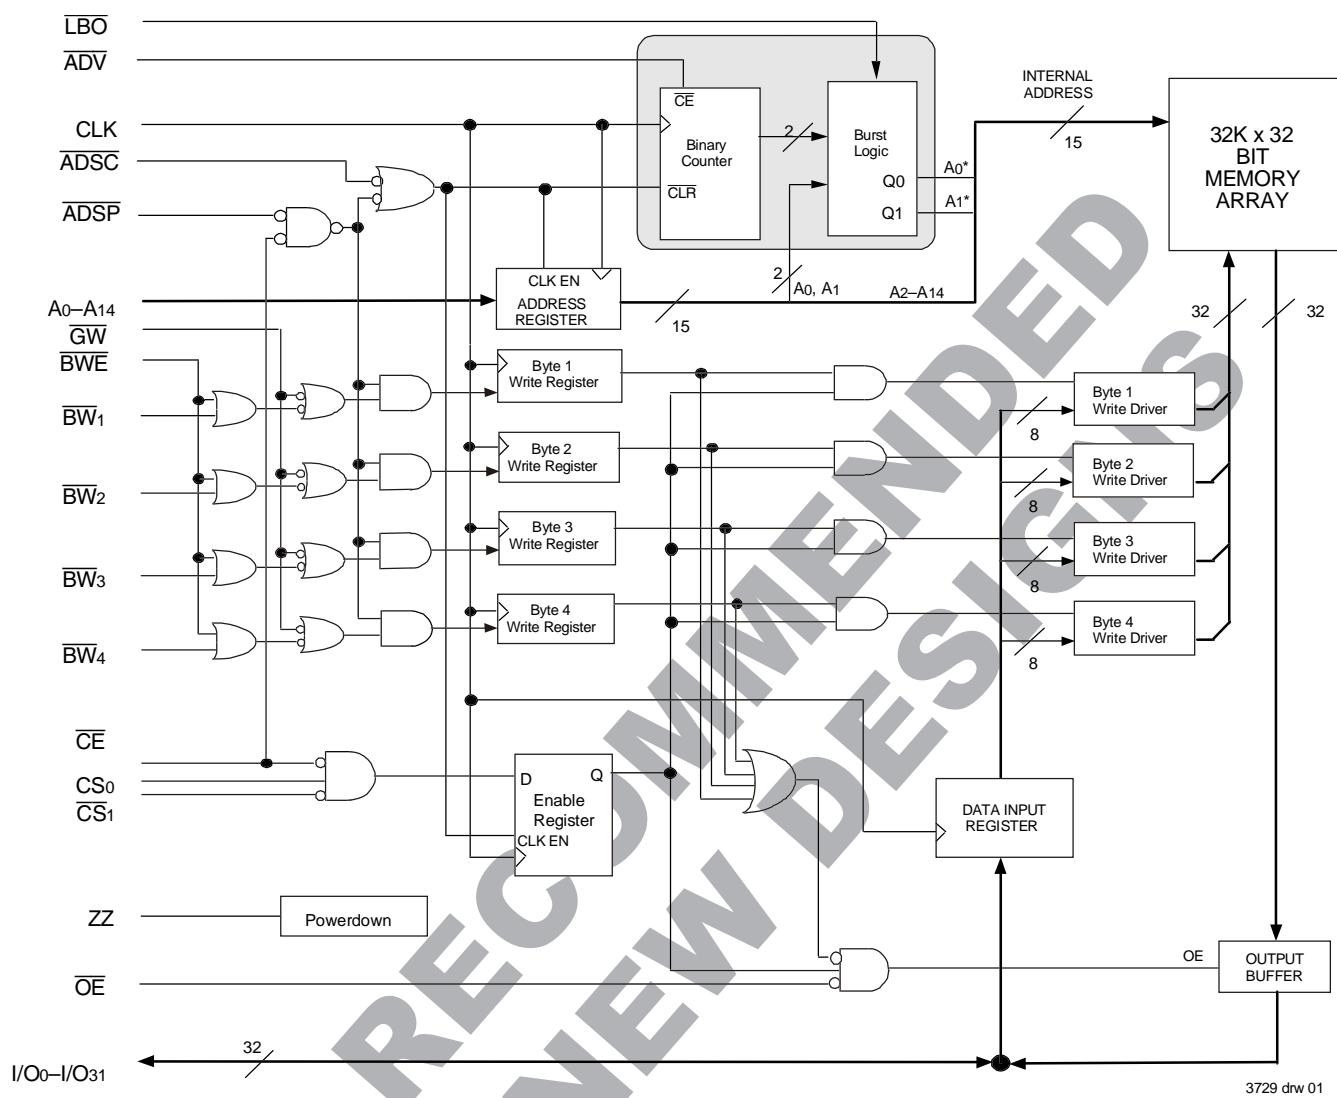

Symbol	Pin Function	I/O	Active	Description
A0-A14	Address Inputs	I	N/A	Synchronous Address inputs. The address register is triggered by a combination of the rising edge of CLK and ADSC Low or ADSP Low and CE Low.
ADSC	Address Status (Cache Controller)	I	LOW	Synchronous Address Status from Cache Controller. ADSC is an active LOW input that is used to load the address registers with new addresses. ADSC is NOT gated by CE.
ADSP	Address Status (Processor)	I	LOW	Synchronous Address Status from Processor. ADSP is an active LOW input that is used to load the address registers with new addresses. ADSP is gated by CE.
ADV	Burst Address Advance	I	LOW	Synchronous Address Advance. ADV is an active LOW input that is used to advance the internal burst counter, controlling burst access after the initial address is loaded. When this input is HIGH the burst counter is not incremented; that is, there is no address advance.
BWE	Byte Write Enable	I	LOW	Synchronous byte write enable gates the byte write inputs BW1-BW4. If BWE is LOW at the rising edge of CLK then BWx inputs are passed to the next stage in the circuit. A byte write can still be blocked if ADSP is LOW at the rising edge of CLK. If ADSP is HIGH and BWx is LOW at the rising edge of CLK then data will be written to the SRAM. If BWE is HIGH then the byte write inputs are blocked and only GW can initiate a write cycle.
BW1-BW4	Individual Byte Write Enables	I	LOW	Synchronous byte write enables. BW1 controls I/O(7:0), BW2 controls I/O(15:8), etc. Any active byte write causes all outputs to be disabled. ADSP LOW disables all byte writes. BW1-BW4 must meet specified setup and hold times with respect to CLK.
CE	Chip Enable	I	LOW	Synchronous chip enable. CE is used with CS0 and CS1 to enable the IDT71V433. CE also gates ADSP.
CLK	Clock	I	N/A	This is the clock input. All timing references for the device are made with respect to this input.
CS0	Chip Select 0	I	HIGH	Synchronous active HIGH chip select. CS0 is used with CE and CS1 to enable the chip.
CS1	Chip Select 1	I	LOW	Synchronous active LOW chip select. CS1 is used with CE and CS0 to enable the chip.
GW	Global Write Enable	I	LOW	Synchronous global write enable. This input will write all four 8-bit data bytes when LOW on the rising edge of CLK. GW supercedes individual byte write enables.
I/O0-I/O31	Data Input/Output	I/O	N/A	Synchronous data input/output (I/O) pins. Only the data input path is registered and triggered by the rising edge of CLK. Outputs are Flow-Through.
LBO	Linear Burst	I	LOW	When LBO is HIGH the Interleaved Order (Intel) burst sequence is selected. When LBO is LOW the Linear (PowerPC) burst sequence is selected. LBO has an internal pull-up resistor.
OE	Output Enable	I	LOW	Asynchronous output enable. When OE is HIGH the I/O pins are in a high-impedance state. When OE is LOW the data output drivers are enabled if the chip is also selected.
VDD	Power Supply	N/A	N/A	3.3V core power supply inputs.
VDDQ	Power Supply	N/A	N/A	3.3V I/O power supply inputs.
Vss	Ground	N/A	N/A	Core ground pins.
VSSQ	Ground	N/A	N/A	I/O ground pins.
NC	No Connect	N/A	N/A	NC pins are not electrically connected to the chip.
ZZ	Sleep Mode	I	HIGH	Asynchronous sleep mode input. ZZ HIGH will gate the CLK internally and power down the IDT71V433 to its lowest power consumption level. Data retention is guaranteed in Sleep Mode. ZZ has an internal pull-down resistor.

NOTE:

- All synchronous inputs must meet specified setup and hold times with respect to CLK.

### NOTES:

- Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
- VDD, VDDQ and input terminals only.
- I/O terminals.

### NOTES

1. Pin 14 does not have to be directly connected to Vss as long as the input voltage is  $\leq$  VIL.
2. Pin 64 can be left unconnected and the device will always remain in active mode.

## Timing Waveform of Read Cycle<sup>(1,2)</sup>

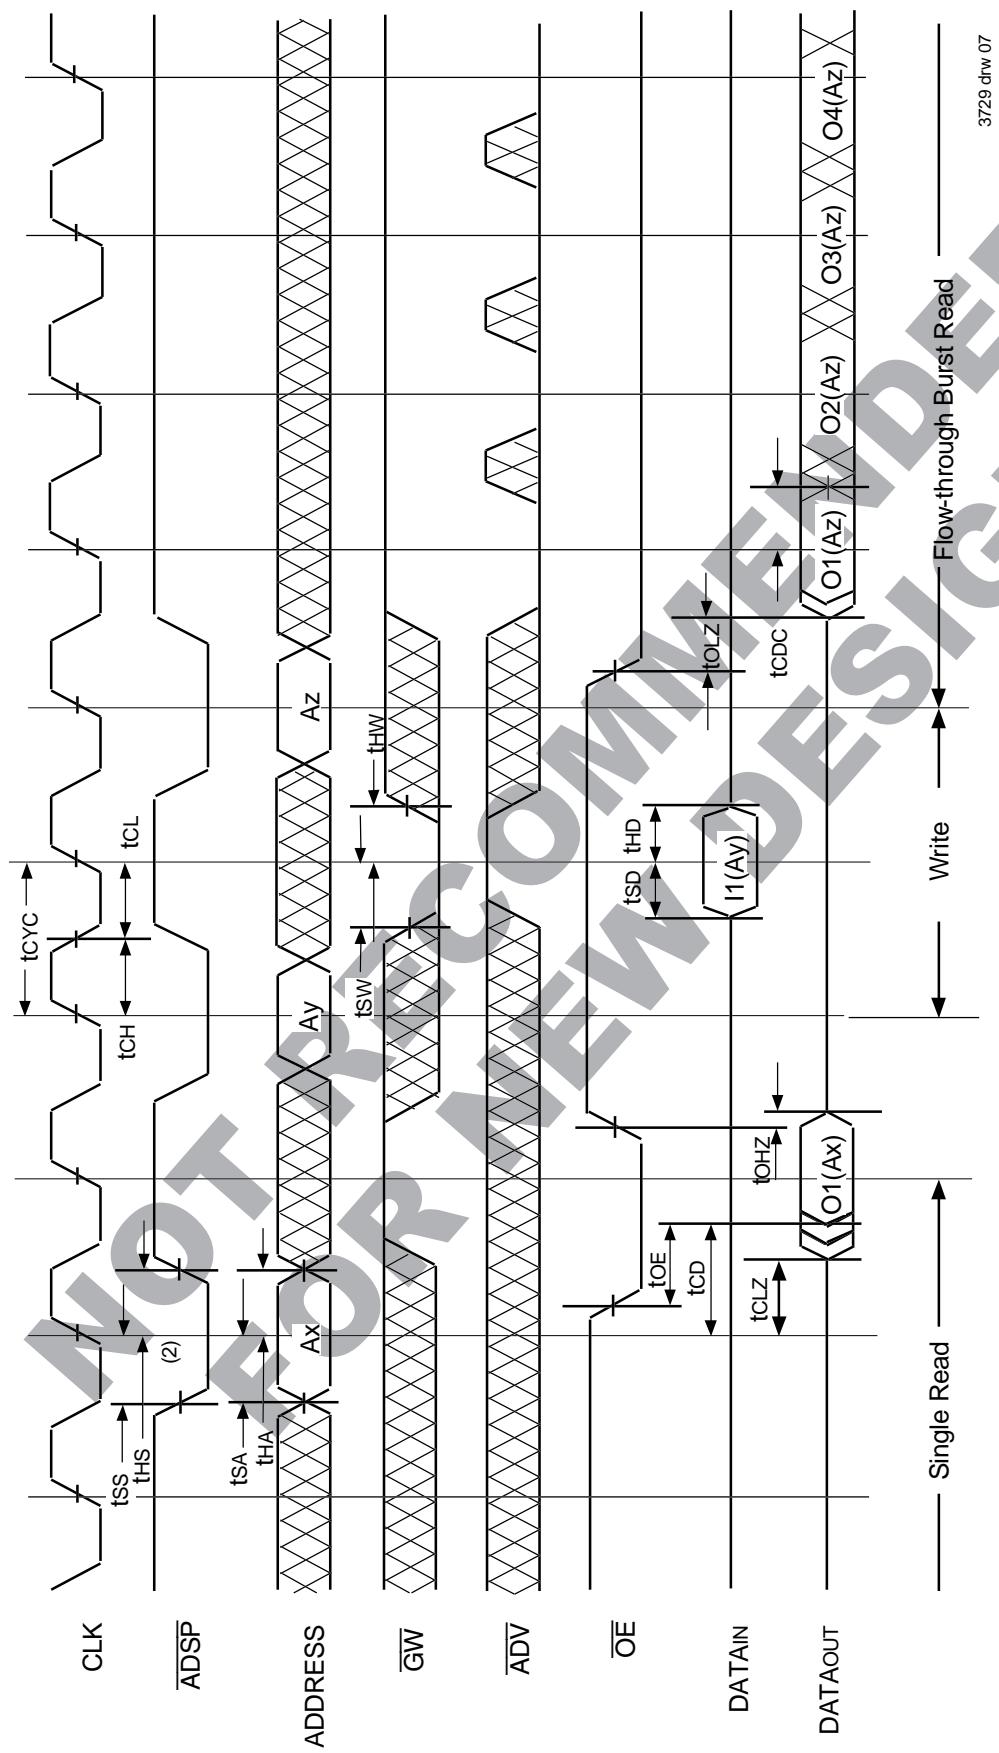

### NOTES:

1. O1 (Ax) represents the first output from the external address Ax. O2 (Ay) represents the next output from the external address Ay. O1 (Ay) represents the first output data in the burst sequence of the base address Ay, etc., where A0 and A1 are advancing for the four word burst in the sequence defined by the state of the LBO input.
2. ZZ input is LOW and LBO is Don't Care for this cycle.
3. CS0 timing transitions are identical but inverted to the CE and CS1 signals. For example, when CE and CS1 are LOW on this waveform, CS0 is HIGH.

## Timing Waveform of Write Cycle No. 1 — **GW Controlled<sup>(1,2,3)</sup>**

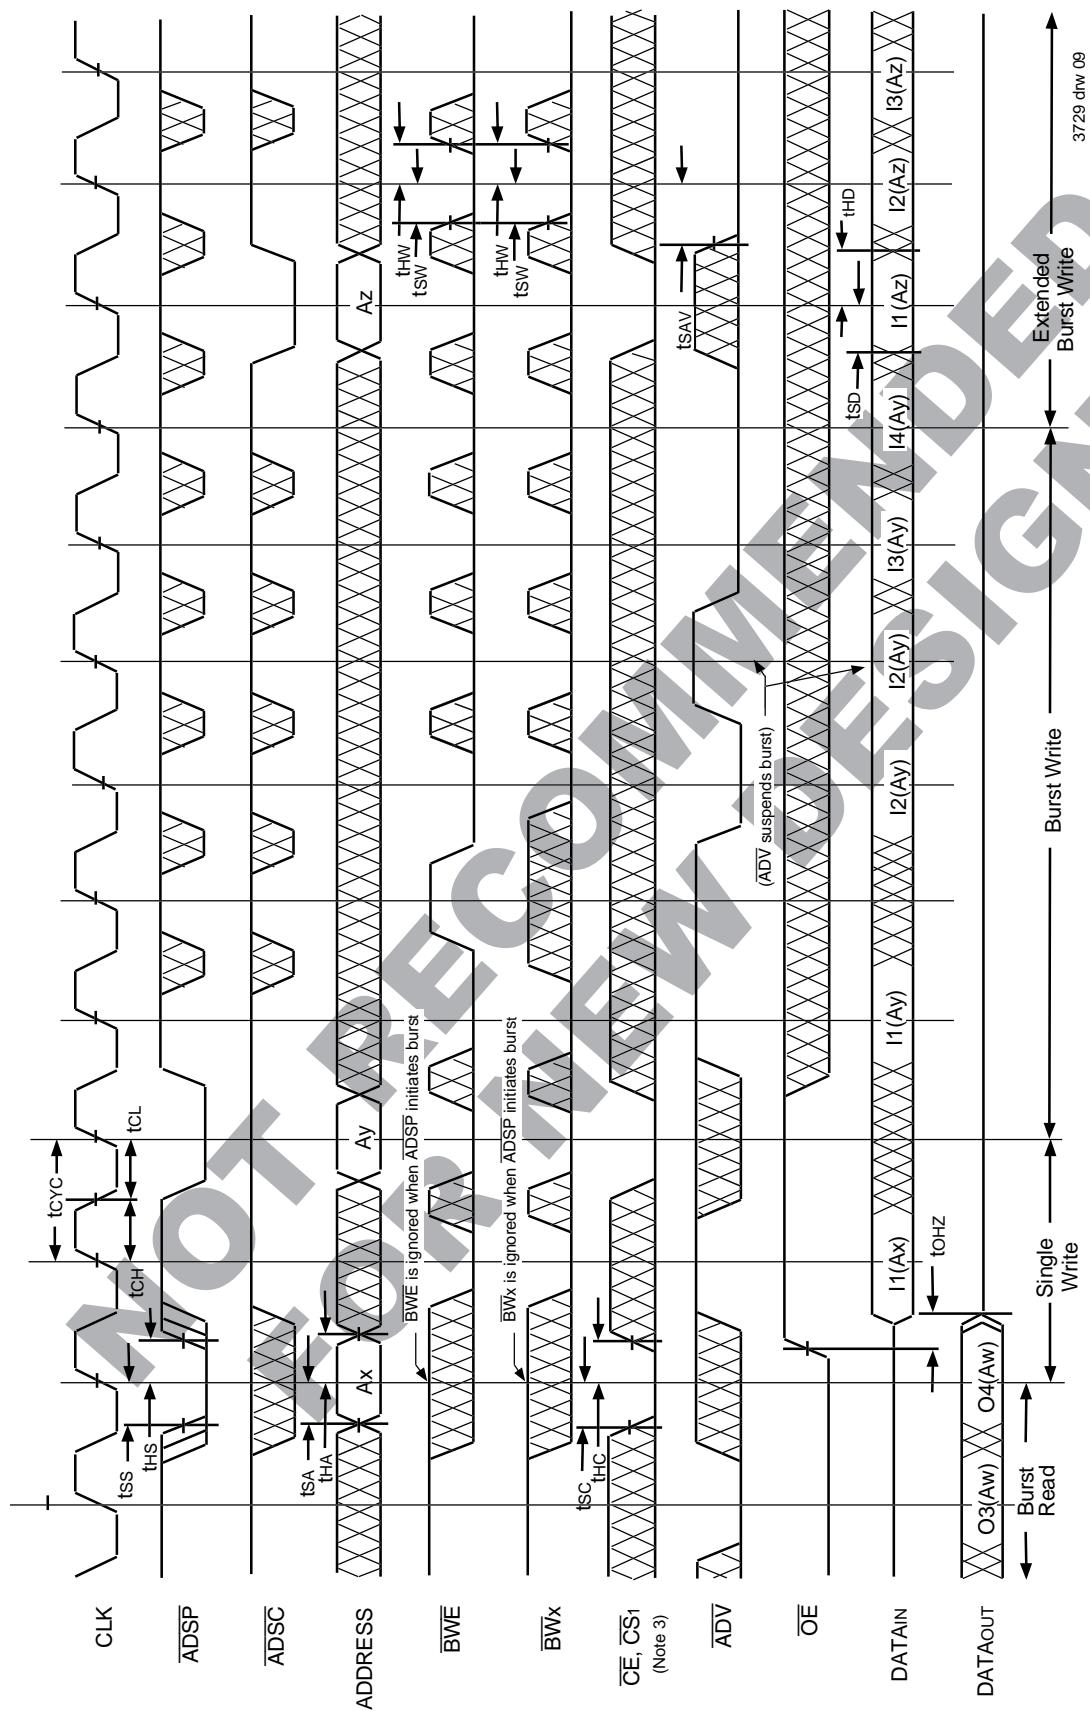

### NOTES:

1. ZZ input is LOW, BWE is HIGH, and LBO is Don't Care for this cycle.
2. O4 (Aw) represents the final output data in the burst sequence of the base address Aw. I1 (Ay) represents the first input from the external address Ay. I2 (Ay) represents the next input data in the burst sequence of the base address Ay, etc., where A0 and A1 are advancing for the four word burst in the sequence defined by the state of the LBO input. In the case of input I2(Ay) this data is valid for two cycles because ADV is high and has suspended the burst.
3. CS<sub>0</sub> timing transitions are identical but inverted to the CS<sub>1</sub> and CS<sub>1</sub> signals. For example, when CS<sub>1</sub> and CS<sub>1</sub> are LOW on this waveform, CS<sub>0</sub> is HIGH.

## Timing Waveform of Write Cycle No. 2 — Byte Controlled<sup>(1,2,3)</sup>

### NOTES:

1. ZZ input is LOW,  $\overline{GW}$  is HIGH, and  $\overline{LB\bar{O}}$  is Don't Care for this cycle.
2. O4 (Aw) represents the final output data in the burst sequence of the base address Aw. I1 (Ay) represents the first input from the external address Ay. I2 (Ay) represents the next input data in the burst sequence of the base address Ay, etc., where A0 and A1 are advancing for the four word burst in the sequence defined by the state of the  $\overline{LB\bar{O}}$  input. In the case of input I2(Ay) this data is valid for two cycles because  $\overline{ADV}$  is high and has suspended the burst.
3. CS0 timing transitions are identical but inverted to the  $\overline{CE}$  and  $\overline{CS1}$  signals. For example, when  $\overline{CE}$  and  $\overline{CS1}$  are LOW on this waveform, CS0 is HIGH.

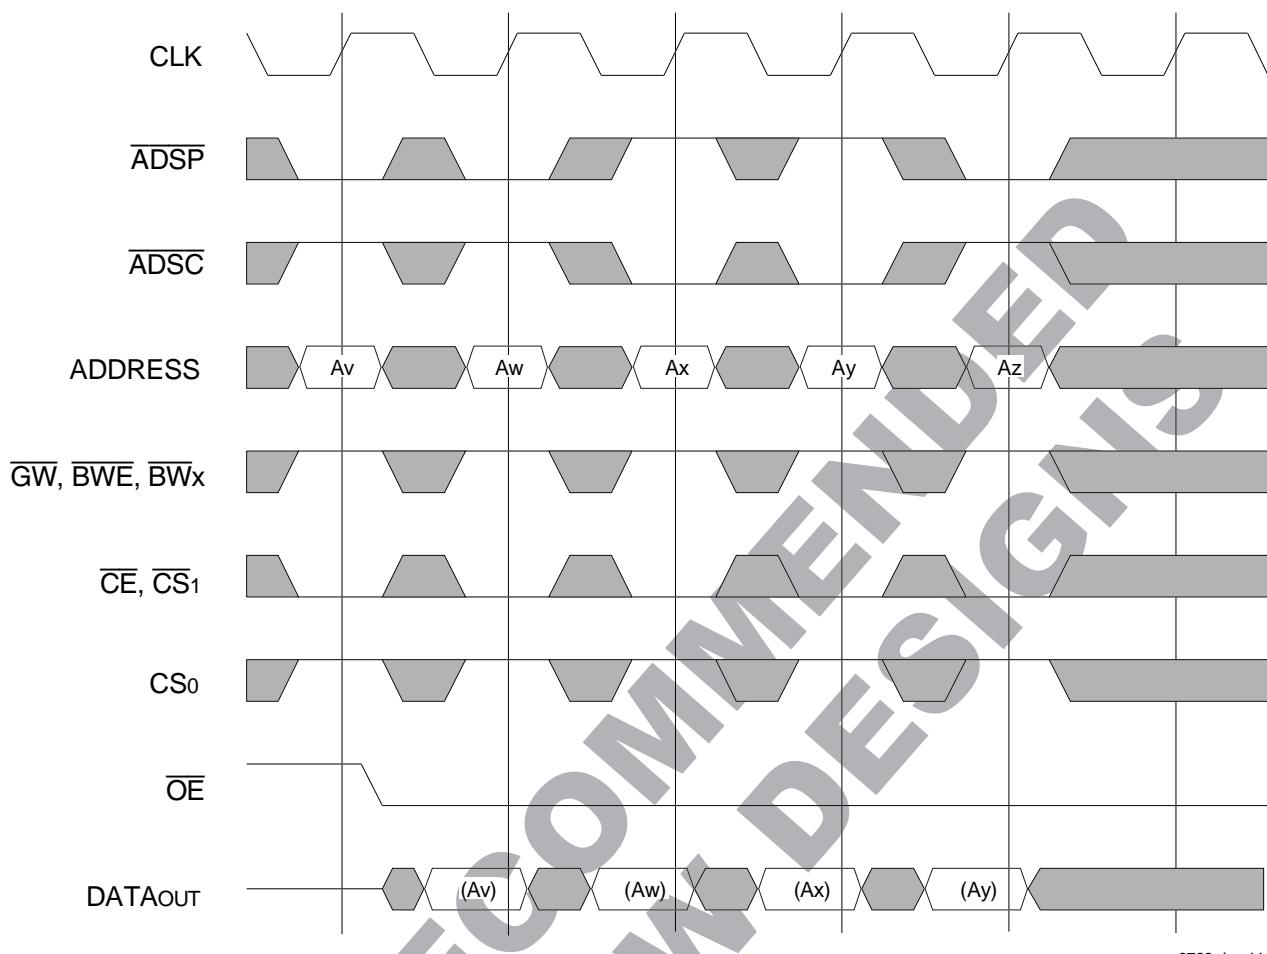

## Timing Waveform of Sleep (ZZ) and Power-Down Modes<sup>(1,2,3)</sup>

### NOTES:

1. Device must power up in deselected mode.
2. LBO input is Don't Care for this cycle.
3. It is not necessary to retain the state of the input registers throughout the Power-down cycle.
4. CS0 timing transitions are identical but inverted to the CE and CS1 signals. For example, when CE and CS1 are LOW on this waveform, CS0 is HIGH.

**NOTES:**

1. ZZ input is LOW,  $\overline{ADV}$  is HIGH, and  $\overline{LBO}$  is Don't Care for this cycle.
2. (Ax) represents the data for address Ax, etc.
3. For read cycles,  $\overline{ADSP}$  and  $\overline{ADSC}$  function identically and are therefore interchangeable.
