74LCXH162244

Low Voltage 16-Bit Buffer/Line Driver with Bushold and 26 Ω Series Resistors in Outputs

General Description

The LCXH162244 contains sixteen non-inverting buffers with 3-STATE outputs designed to be employed as a memory and address driver, clock driver, or bus oriented transmitter/receiver. The device is nibble controlled. Each nibble has separate 3-STATE control inputs which can be shorted together for full 16-bit operation.

The LCXH162244 data inputs include active bushold circuitry, eliminating the need for external pull-up resistors to hold unused or floating data inputs at a valid logic level.

In addition, the outputs include equivalent 26 Ω (nominal) series resistors to reduce overshoot and undershoot and are designed to sink/source up to 12 mA at $V_{CC}=3.0V$.

The LCXH162244 is designed for low voltage (2.5V or 3.3V) $\rm V_{CC}$ applications with capability of interfacing to a 5V signal environment.

The LCXH162244 is fabricated with an advanced CMOS technology to achieve high speed operation while maintaining CMOS low power dissipation.

Features

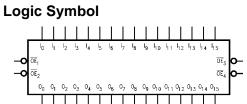

- 5V tolerant control inputs and outputs
- 2.3V-3.6V V_{CC} specifications provided
- \blacksquare Outputs include equivalent series resistance of 26Ω to make external termination resistors unnecessary and reduce overshoot and undershoot
- Bushold on data inputs eliminates the need for external pull-up/pull-down resistors
- 5.3 ns t_{PD} max ($V_{CC} = 3.0V$), 20 $\mu A I_{CC}$ max
- Power down high impedance inputs and outputs
- ± 12 mA output drive (V_{CC} = 3.0V)
- Implements patented noise/EMI reduction circuitry
- Latch-up performance exceeds 500 mA
- ESD performance:

Functional Description

The LCXH162244 contains sixteen non-inverting buffers with 3-STATE standard outputs. The LCXH162244 data inputs include active bushold circuitry eliminating the need for pull-up resistors to hold unused or floating data inputs at a valid logic level. The devise is also designed with 26Ω series resistors in the outputs. This design reduces line noise in applications such as memory address drivers, clock drivers and bus transceiver/transmitters. The device is nibble (4 bits) controlled with each nibble functioning

identically, but independent of the other. The control pins can be shorted together to obtain full 16-bit operation. The 3-STATE outputs are controlled by an Output Enable (\overline{OE}_n) input for each nibble. When \overline{OE}_n is LOW, the outputs are in 2-state mode. When \overline{OE}_n is HIGH, the outputs are in the high impedance mode, but this does not interfere with entering new data into the inputs.

Note 1: The Absolute Maximum Ratings are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the Electrical Characteristics tables are not guaranteed at the Absolute Maximum Ratings. The "Recommended Operating Conditions" table will define the conditions for actual device operation.

Note 3: Unused control inputs must be held HIGH or LOW. They may not float.
