

100370

Low Power Universal Demultiplexer/Decoder

General Description

The 100370 universal demultiplexer/decoder functions as either a dual 1-of-4 decoder or as a single 1-of-8 decoder, depending on the signal applied to the Mode Control (M) input. In the dual mode, each half has a pair of active-LOW Enable ($\bar{E}$) inputs. Pin assignments for the $\bar{E}$ inputs are such that in the 1-of-8 mode they can easily be tied together in pairs to provide two active-LOW enables ($\bar{E}_{1a}$ to $\bar{E}_{1b}$, $\bar{E}_{2a}$ to $\bar{E}_{2b}$). Signals applied to auxiliary inputs H_a , H_b and H_c determine whether the outputs are active HIGH or active LOW. In the dual 1-of-4 mode the Address inputs are A_{0a} , A_{1a} and A_{0b} , A_{1b} with A_{2a} unused (i.e., left open, tied to V_{EE} or with LOW signal applied). In the 1-of-8 mode, the Address inputs are A_{0a} , A_{1a} , A_{2a} with A_{0b} and A_{1b} LOW or OPEN. All inputs have 50 k Ω pull-down resistors.

Note 2: The "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the Electrical Characteristics tables are not guaranteed at the absolute maximum rating. The "Recommended Operating Conditions" table will define the conditions for actual device operation.

Note 3: ESD testing conforms to MIL-STD-883, Method 3015.

Note 4: The specified limits represent the "worst case" value for the parameter. Since these values normally occur at the temperature extremes, additional noise immunity and guardbanding can be achieved by decreasing the allowable system operating ranges. Conditions for testing shown in the tables are chosen to guarantee operation under "worst case" conditions.
