R3111xxx1A/C Series

APPLICATION MANUAL

R3111xxx1A/C SERIES

OUTLINE

The R3111 Series are voltage detector ICs with high detector threshold accuracy and ultra-low supply current by CMOS process, which can be operated at an extremely low voltage and is used for system reset as an example.

Each of these ICs consists of a voltage reference unit, a comparator, resistors for detector threshold setting, an output driver and a hysteresis circuit. The detector threshold is fixed with high accuracy internally and does not require any adjustment.

Two output types, Nch open drain type and CMOS type are available.

The R3111 Series are operable at a lower voltage than that for the RX5VL Series, and can be driven by a single battery.

Four types of packages, TO-92, SOT-89, SOT-23-5 and SC-82AB are available.

FEATURES

- Ultra-low Supply Current.....TYP. $0.8\mu\text{A}$ ($V_{DD}=1.5\text{V}$)
- Wide Range of Operating Voltage.....0.7 to 10.0V ($T_{\text{opt}}=25^{\circ}\text{C}$)
- Detector Threshold.....Stepwise setting with a step of 0.1V in the range of 0.9V to 6.0V is possible.
- High Accuracy Detector Threshold..... $\pm 2.0\%$
- Low Temperature-Drift Coefficient of Detector Threshold TYP. $\pm 100\text{ppm}/^{\circ}\text{C}$
- Two Output TypesNch Open Drain and CMOS
- Four Types of Packages.....TO-92, SOT-89(Mini-power Mold), SOT-23-5 (Mini-mold), SC-82AB

APPLICATIONS

- CPU and Logic Circuit Reset
- Battery Checker
- Window Comparator
- Wave Shaping Circuit
- Battery Back-up Circuit
- Power Failure Detector

TIMING CHART

DEFINITION OF OUTPUT DELAY TIME

Output Delay Time t_{PLH} is defined as follows:

1. In the case of Nch Open Drain Output:

Under the condition of the output pin (OUT) is pulled up through a resistor of $470k\Omega$ to 5V, the time interval between the rising edge of V_{DD} pulse from 0.7V to $(+V_{DET}) + 2.0V$ and becoming of the output voltage to 2.5V.

2. In the case of CMOS Output:

The time interval between the rising edge of V_{DD} pulse from 0.7V to $(+V_{DET}) + 2.0V$ and becoming of the output voltage to $(V_{DD}/2)$ V.

OPERATION

Figure 1. Block Diagram

Figure 2. Operation Diagram

- Step 1. Output Voltage is equal to Supply Voltage (V_{DD}).
- Step 2. At Point “A”, $V_{ref} \geq V_{DD} \times (Rb + Rc) / (Ra + Rb + Rc)$ is true, as a result, the output of comparator is reverse, and output voltage becomes to GND level. The voltage level of Point A means detector threshold voltage, or ($-V_{DET}$).
- Step 3. When the supply voltage is less than minimum operating voltage, the operation of output transistor becomes indefinite, and in the case that output is pulled up to V_{DD} , Output voltage equals to V_{DD} voltage.
- Step 4. Output Voltage equals to GND level.
- Step 5. At Point “B”, $V_{ref} \leq V_{DD} \times Rb / (Ra + Rb)$ is true, Output of the comparator is reverse, and output voltage is equal to the supply voltage, or (V_{DD}). The voltage level of Point B means released voltage, or ($+V_{DET}$).
- * The difference between Released Voltage and Detector Threshold Voltage is Detector Threshold Hysteresis.

Hysteresis Voltage

$$= (V_{HYS}) * (Ra + Rb) / Rb$$

*) If the value of Ra is set excessively large, voltage drop may occur caused by the supply current of IC itself, and detector threshold may vary.

TECHNICAL NOTES

Figure 9

Figure 10

1. In Figure 9, When R3111xxx1C is used, and if an impedance is connected in between Voltage Supplier and the V_{DD} Pin of R3111xxx1C Series, the operation might be unstable by through-type current at detection. When R3111xxx1A is used in Figure 9, if the value of R is set excessively large, voltage drop may occur caused by supply current of IC itself and Detector threshold may vary.
2. Wiring as shown in Figure 10 may cause the oscillation in both output types of R3111 Series.
