

# SWITCHMODE™ NPN Silicon Planar Power Transistor

The BUH150 has an application specific state-of-art die designed for use in 150 Watts Halogen electronic transformers.

This power transistor is specifically designed to sustain the large inrush current during either the start-up conditions or under a short circuit across the load.

This High voltage/High speed product exhibits the following main features:

- Improved Efficiency Due to the Low Base Drive Requirements:  
High and Flat DC Current Gain  $h_{FE}$   
Fast Switching
- Robustness Thanks to the Technology Developed to Manufacture this Device
- ON Semiconductor Six Sigma Philosophy Provides Tight and Reproducible Parametric Distributions

## MAXIMUM RATINGS

| Rating                                               | Symbol         | Value      | Unit                |
|------------------------------------------------------|----------------|------------|---------------------|
| Collector-Emitter Sustaining Voltage                 | $V_{CEO}$      | 400        | Vdc                 |

 $R_{B2} = 0$   
 $V_{CC} = 15 \text{ Volts}$   
 $R_{B1}$  selected for desired  $I_{B1}$

TYPICAL THERMAL RESPONSE

Figure 21. Forward Bias Power Derating

There are two limitations on the power handling ability of a transistor: average junction temperature and second breakdown. Safe operating area curves indicate  $I_C$ - $V_{CE}$  limits of the transistor that must be observed for reliable operation; i.e., the transistor must not be subjected to greater dissipation than the curves indicate. The data of Figure 22 is based on  $T_C = 25^{\circ}\text{C}$ ;  $T_{J(pk)}$  is variable depending on power level. Second breakdown pulse limits are valid for duty cycles to 10% but must be derated when  $T_C > 25^{\circ}\text{C}$ . Second breakdown limitations do not derate the same as thermal limitations. Allowable current at the voltages shown on Figure 22 may be found at any case temperature by using the appropriate curve on Figure 21.

$T_{J(pk)}$  may be calculated from the data in Figure 24. At any case temperatures, thermal limitations will reduce the power that can be handled to values less than the limitations imposed by second breakdown. For inductive loads, high voltage and current must be sustained simultaneously during turn-off with the base to emitter junction reverse biased. The safe level is specified as a reverse biased safe operating area (Figure 23). This rating is verified under clamped conditions so that the device is never subjected to an avalanche mode.
