# 10-TAP, TTL-INTERFACED **FIXED DELAY LINE SERIES DDU7F)**

#### **FEATURES**

- Ten equally spaced outputs
- Fits standard 14-pin DIP socket
- Low profile
- Auto-insertable
- Input & outputs fully TTL interfaced & buffered
- 10 T<sup>2</sup>L fan-out capability

## **PACKAGES**

#### FUNCTIONAL DESCRIPTION

The DDU7F-series device is a 10-tap digitally buffered delay line. The signal input (IN) is reproduced at the outputs (T1-T10), shifted in time by an amount determined by the device dash number. The nominal tap-to-tap delay increment is given by 1/10 of the dash number. For dash numbers less than 50, the total delay of the line is measured from T1 to T10, with the PIN DESCRIPTIONS

Signal Input IN T1-T10 Tap Outputs **VCC** +5 Volts **GND** Ground

nominal value given by 9 times the increment. The inherent delay from IN to T1 is nominally 3.5ns. For dash numbers greater than or equal to 50, the total delay of the line is measured from IN to T10, with the nominal value given by the dash number.

## SERIES SPECIFICATIONS

Minimum input pulse width: 20% of total delay

Output rise time: 2ns typical Supply voltage:  $5VDC \pm 5\%$ 

**Supply current:**  $I_{CCL} = 50$ ma typical

 $I_{CCH} = 15$ ma typical

Operating temperature: 0° to 70° C

Temp. coefficient of total delay: 100 PPM/°C

## **APPLICATION NOTES**

## HIGH FREQUENCY RESPONSE

The DDU7F tolerances are guaranteed for input pulse widths and periods greater than those specified in the test conditions. Although the device will function properly for pulse widths as small as 20% of the total delay and periods as small as 40% of the total delay (for a symmetric input), the delays may deviate from their values at low frequency. However, for a given input condition, the deviation will be repeatable from pulse to pulse. Contact technical support at Data Delay Devices if your application requires device testing at a specific input condition.

#### POWER SUPPLY BYPASSING

The DDU7F relies on a stable power supply to produce repeatable delays within the stated tolerances. A 0.1uf capacitor from VCC to GND, located as close as possible to the VCC pin, is recommended. A wide VCC trace and a clean ground plane should be used.
