Features

- Flow Through mode operation
- 3.3 V +10%/–5% core power supply
- 2.5 V or 3.3 V I/O supply
- $\overline{LBO}$ pin for Linear or Interleaved Burst mode
- Internal input resistors on mode pins allow floating mode pins
- Default to Interleaved Pipelined mode
- Byte Write ($\overline{BW}$) and/or Global Write ($\overline{GW}$) operation
- Common data inputs and data outputs
- Clock Control, registered, address, data, and control
- Internal self-timed write cycle
- Automatic power-down for portable applications
- JEDEC standard 100-lead TQFP

Functional Description

Applications

The GS840F18/32/36A is a 4,718,592-bit (4,194,304-bit for x32 version) high performance synchronous SRAM with a 2-bit burst address counter. Although of a type originally developed for Level 2 Cache applications supporting high performance CPUs, the device now finds application in synchronous SRAM applications, ranging from DSP main store to networking chip set support. The GS840F18/32/36A is available in a JEDEC standard 100-lead TQFP package.

Controls

Addresses, data I/Os, chip enables ($\overline{E_1}$, E_2 , $\overline{E_3}$), address burst control inputs ($\overline{ADSP}$, $\overline{ADSC}$, $\overline{ADV}$) and write control inputs ($\overline{Bx}$, $\overline{BW}$, $\overline{GW}$) are synchronous and are controlled by a positive-edge-triggered clock input (CK). Output enable ($\overline{G}$) and power down control (ZZ) are asynchronous inputs. Burst cycles can be initiated with either $\overline{ADSP}$ or $\overline{ADSC}$ inputs. In Burst mode, subsequent burst addresses are generated internally and are controlled by $\overline{ADV}$. The burst address counter may be configured to count in either linear or interleave order with the Linear Burst Order ($\overline{LBO}$) input. The Burst function need not be used. New addresses can be loaded on every cycle with no degradation of chip performance.

Designing For Compatibility

The JEDEC Standard for Burst RAMS calls for a $\overline{FT}$ mode pin option (pin 14 on TQFP). Board sites for Flow Through Burst RAMS should be designed with V_{SS} connected to the $\overline{FT}$ pin location to ensure the broadest access to multiple vendor sources. Boards designed with $\overline{FT}$ pin pads tied low may be stuffed with GSI's Pipeline/Flow Through-configurable Burst RAMS or any vendor's Flow Through or configurable Burst SRAM. Bumps designed with the $\overline{FT}$ pin location tied high or floating must employ a non-configurable Flow Through Burst RAM, like this RAM, to achieve flow through functionality.

Byte Write and Global Write

Byte write operation is performed by using Byte Write enable ($\overline{BW}$) input combined with one or more individual byte write signals ($\overline{Bx}$). In addition, Global Write ($\overline{GW}$) is available for writing all bytes at one time, regardless of the Byte Write control inputs.

Sleep Mode

Low power (Sleep mode) is attained through the assertion (high) of the ZZ signal, or by stopping the clock (CK). Memory data is retained during Sleep mode.

Core and Interface Voltages

The GS840F18/32/36A operates on a 3.3 V power supply and all inputs/outputs are 3.3 V- and 2.5 V-compatible. Separate output power (V_{DDQ}) pins are used to decouple output noise from the internal circuit.

Mode Pin Functions

Mode Name	Pin Name	State	Function
Burst Order Control	$\overline{\text{LBO}}$	L	Linear Burst
		H or NC	Interleaved Burst
Output Register Control	$\overline{\text{FT}}$	L	Flow Through
		H or NC	Pipeline
Power Down Control	ZZ	L or NC	Active
		H	Standby, $I_{DD} = I_{SB}$

Note:

There is a are pull-up devices on the $\overline{\text{LBO}}$ and $\overline{\text{FT}}$ pins and a pull-down device on the ZZ pin, so those input pins can be unconnected and the chip will operate in the default states as specified in the above tables.

Notes:

1. All byte outputs are active in read cycles regardless of the state of Byte Write Enable inputs.
2. Byte Write Enable inputs $\overline{\text{B}}_A$, $\overline{\text{B}}_B$, $\overline{\text{B}}_C$, and/or $\overline{\text{B}}_D$ may be used in any combination with BW to write single or multiple bytes.
3. All byte I/Os remain High-Z during all write operations regardless of the state of Byte Write Enable inputs.
4. Bytes "c" and "d" are only available on the x32 and x36 versions.

Notes:

1. X = Don't Care, H = High, L = Low.
2. E = T (True) if $E_2 = 1$ and $E_3 = 0$; E = F (False) if $E_2 = 0$ or $E_3 = 1$.
3. $\overline{W}$ = T (True) and F (False) is defined in the Byte Write Truth Table preceding.
4. $\overline{G}$ is an asynchronous input. $\overline{G}$ can be driven high at any time to disable active output drivers. $\overline{G}$ low can only enable active drivers (shown as "Q" in the Truth Table above).
5. All input combinations shown above are tested and supported. Input combinations shown in gray boxes need not be used to accomplish basic synchronous or synchronous burst operations and may be avoided for simplicity.
6. Tying $\overline{ADSP}$ high and $\overline{ADSC}$ low allows simple non-burst synchronous operations. See **BOLD** items above.
7. Tying $\overline{ADSP}$ high and $\overline{ADV}$ low while using $\overline{ADSC}$ to load new addresses allows simple burst operations. See *ITALIC* items above.

Simplified State Diagram

Notes:

1. The diagram shows only supported (tested) synchronous state transitions. The diagram presumes $\overline{G}$ is tied low.
2. The upper portion of the diagram assumes active use of only the Enable ($\overline{E_1}$, $\overline{E_2}$, $\overline{E_3}$) and Write ($\overline{B_A}$, $\overline{B_B}$, $\overline{B_C}$, $\overline{B_D}$, $\overline{B_W}$, and $\overline{G_W}$) control inputs, and that $\overline{ADSP}$ is tied high and $\overline{ADSC}$ is tied low.
3. The upper and lower portions of the diagram together assume active use of only the Enable, Write, and $\overline{ADSC}$ control inputs, and assumes $\overline{ADSP}$ is tied high and $\overline{ADV}$ is tied low.

Simplified State Diagram with $\overline{G}$

Notes:

1. The diagram shows supported (tested) synchronous state transitions plus supported transitions that depend upon the use of $\overline{G}$.
2. Use of "Dummy Reads" (Read Cycles with $\overline{G}$ High) may be used to make the transition from Read cycles to Write cycles without passing through a Deselect cycle. Dummy Read cycles increment the address counter just like normal Read cycles.
3. Transitions shown in grey tone assume $\overline{G}$ has been pulsed high long enough to turn the RAM's drivers off and for incoming data to meet Data Input Set Up Time.

Notes:

- Unless otherwise noted, all performance specifications quoted are evaluated for worst case at both $2.75\text{ V} \leq V_{DDQ} \leq 2.375\text{ V}$ (i.e., 2.5 V I/O) and $3.6\text{ V} \leq V_{DDQ} \leq 3.135\text{ V}$ (i.e., 3.3 V I/O) and quoted at whichever condition is worst case.
- This device features input buffers compatible with both 3.3 V and 2.5 V I/O drivers.
- Most speed grades and configurations of this device are offered in both Commercial and Industrial Temperature ranges. The part number of Industrial Temperature Range versions end the character "I". Unless otherwise noted, all performance specifications quoted are evaluated for worst case in the temperature range marked on the device.
- Input Under/overshoot voltage must be $-2\text{ V} > V_i < V_{DD}+2\text{ V}$ with a pulse width not to exceed 20% tKC.

Notes:

- Customers requiring delivery in Tape and Reel should add the character "T" to the end of the part number. Example: GS840F32AT-7.5T.
- The speed column indicates the cycle frequency (MHz) of the device in Pipelined mode and the latency (ns) in Flow Through mode. Each device is Pipeline/Flow Through mode-selectable by the user.
- T_A = C = Commercial Temperature Range. T_A = I = Industrial Temperature Range.
- GSI offers other versions this type of device in many different configurations and with a variety of different features, only some of which are covered in this data sheet. See the GSI Technology web site (www.gsistechnology.com) for a complete listing of current offerings.

Revision History

Rev. Code: Old; New	Types of Changes Format or Content	Page /Revisions;Reason
GS84018/32/362/2000G; 840F18A_r1_02	Content	• Updated pin description table
840F18A_r1_02; 840F18A_r1_03	Content/Format	• Added “non-A” speed bins to Operating Currents table, AC Electrical Characteristics table, and Ordering Information table • Updated format to fit Technical Documentation standards
840F18A_r1_03; 840F18A_r1_04	Content/Format	• Updated table on page 1 • Updated Operating Currents table on page 14 • Updated AC Electrical Characteristics table on page 14 • Updated format to comply with present Technical Documentation standards
840F18A_r1_04; 840F18A_r1_05	Content	• Reduced I_{DD} by 20 mA in table on page 1 and Operating Currents table
