

d110001 **512X16, Mux 8, Drive 3, Non-Pipelined** **High-Speed Single-Port Synchronous SRAM**

Features

- Precise Optimization for Infineon's C9DD1 0.20μm Embedded DRAM Process
- Fast Access Time (2.06ns at typical process, 2.50V, 25°C)
- Fast Cycle Time (1.78ns at typical process, 2.50V, 25°C)
- Extremely High Density (area is 0.61mm²)
- Universal Test Interface™
- Completely Static Operation
- Optional Output Register (Pipeline)
- Near-Zero Hold Time (Data, Address, and Control Inputs)
- Selectable Frequency
- Selectable Output Drive Strengths (3X and 12X)

Memory Description

The 512X16 SRAM is a high-performance, synchronous single-port, 512-word by 16-bit memory designed to take full advantage of Infineon's C9DD1 0.20μm embedded DRAM process.

The SRAM's storage array is composed of six-transistor cells and all memory circuitry is fully static. The SRAM operates at a voltage of 2.5V ± 10% and a junction temperature range of -25°C to +110°C.

SRAM Logic Table

CEN	WEN	OEN	Data Out	Mode	Function
H	X	L	Last Data	Standby	Address inputs are disabled; data stored in the memory is retained, but the memory cannot be accessed for new reads or writes. Data outputs remain stable.
L	L	L	Data In	Write	Data on the data input bus D[n-1:0] is written to the memory location specified on the address bus A[m-1:0], and driven through to the data output bus Q[n-1:0].
L	H	L	SRAM Data	Read	Data on the data output bus Q[n-1:0] is read from the memory location specified on the address bus A[m-1:0].
X	X	H	Z	High-Z	The data output bus Q[n-1:0] is placed in a high impedance state. Other memory operations are unaffected.

During normal read and write operations, the signals TMS and TIS must be low.

Pin Capacitance

Typical Process, 2.50 Volts, 25°C

Pin	Value (pF)
A[j:0]	0.090
D[i:0]	0.022
CLK	0.326
CEN	0.047

Area

Height (μm)	Width (μm)	Area (mm ²)
846.08	723.10	0.61

Height, width and area include ring size = 105μm

Power

Typical Process, 2.50 Volts, 25°C, 100.00MHz Operation

Condition	Value (mA)
AC Current ¹	16.27
Read AC Current	15.22
Write AC Current	17.31
Peak Current	234.96
Deselected Current ²	7.91
Standby Current ³	leakage only

¹ Value assumes 50% read and write operations

² Value assumes SRAM is deselected, CLK switches, and half of data and address inputs switch

³ Value assumes SRAM is deselected and only CLK switches

Power and Ground Noise Limit

Typical Process, 2.50 Volts, 25°C

Signal	Interval	Voltage (V)
Power	memory cycle	0.50
Ground	memory cycle	0.50

The power/ground noise limit is the maximum supply voltage transition allowable within a memory cycle without causing a memory failure

Clock Noise Limit

Typical Process, 2.50 Volts, 25°C

Signal	Pulse Width (ns)	Voltage (V)
CLK	10.00	1.13

The clock noise limit is the maximum CLK voltage allowable for the indicated pulse width without causing a spurious memory cycle or other memory failure
