- UL Component Recognized
- Provision for External Synchronization
- High Linearity: 0.0050% Peak, Typical
- High Input/output Isolation: 5000VDC continuous, 3000VAC RMS
- 1000:1 Programmable Gain
- Low Drift: $\pm 0.01\%$ / °C Maximum
- 126dB Common-Mode Rejection

The Model IA175 Isolation Amplifier features very high linearity, input/output isolation, and common-mode rejection, very low drift, and externally programmable gain. Its 0.005% linearity assures compatibility with 12-bit data acquisition systems, and its ability to operate at common-mode input voltages up to 5000VDC enables operation with single sources in high voltage systems and other hazardous locations. Common-mode rejection is at least 120dB with source imbalance of up to 5000 ohms. Input voltage noise is 1 μ V, 10Hz to 1kHz, and current noise is 10pA for the same range. The gain of the amplifier is programmable from 1V/V to 1000V/V by means of an externally connected resistance value. The internal oscillator used to provide modulation and demodulation for input isolation can be synchronized with those of associated Model IA175 amplifiers by means of an external trigger, to avoid imposition of beat-frequency phenomena on the output signals. An independent ± 14 VDC, ± 5 mA supply in the input section, with the same voltage isolation as the amplifier input, is used to power an external transducer, or preamplifier.

CONNECTION NOTES:

1. Gain adjustment resistor (Rg) is connected between GAIN and LO-IN pins.
2. If no output-offset adjustment is required, connect LO-OUT to COMMON pin. Otherwise, consult factory.
