DESCRIPTION

The CSP5814 is a high speed, low noise non-inverting buffer designed for SDRAM clock buffer applications. Out of the 14 outputs, 12 could be used to drive up to four SDRAM SO-DIMMS, and the remaining can be used for external feedback to a PLL stage for synchronization to master clock.

The CSP5814 also includes an I^{2}C interface, which can enable or disable each output clock when the lines are not used. By turning the outputs on and off, I^{2}C will aid in reducing the Electro Magnetic Interference (EMI).

I²C SERIAL INTERFACE CONTROL

The I²C interface permits individual enable/disable of each clock output: any unused outputs may be disabled to reduce the EMI. The CSP5814 is a slave receiver device. It can read back the data stored in the latches for verification.

The data transfer rate supported by the I²C interface is 100k bits/sec. Data is transferred in bytes (with the addition of start, stop, acknowledge bits) in sequential order from the lowest to highest byte with the ability to stop after any complete byte has been transferred. The first two bytes transferred must be a Command Code followed by a Byte Count. Both of these bytes are ignored by the device.

The I²C address of the CSP5814 is:

A7	A6	A5	A4	A3	A2	A1
1	1	0	1	0	0	1

Address A0 is the read/write bit and is set to 0 for writes and 1 for reads. During read back, the first byte read is a Byte Count representing the number of bytes following (fixed at 3).
