CMOS PLL

PRODUCT FEATURES

- Integrates clock generator and distribution buffers
- 3 or 5 volt operation
- Supports Pentium™ and Cyrix based designs
- < 200 ps typical buffer skew on PCLK and on BLCK
- Supports SIO and KBD clocks
- Designed to Intel's clock specification.
- 60 mA switching current.
- Two Package Types: 28 Pin SOIC or 28 Pin SSOP

BLOCK DIAGRAM**PRODUCT DESCRIPTION**

The IMISC618 provides the clock frequencies and clock distribution buffers required on a Pentium™ synchronous PCI system board. The SC618 contains PLL's for fixed and programmable clocks, fan-out buffers for the CPU and PCI busses, and operates from a 3.3V or 5V power source. The frequency selection of the PCLK outputs is determined by the S0-S1 pins. The on-chip buffers provide the low skew performance required by the CPU and PCI busses.

AVSS	11	18	BCLK3
S1	12	17	VSS
S0	13	16	BCLK2
AVDD	14	15	BCLK1

APPLICATIONS

The IMISC618 supports synchronous Pentium™ designs by providing clock distribution for the CPU and PCI bus and system fixed frequencies. The performance, functionality, and pin out conform to the Intel Triton core logic requirements.

PIN DESCRIPTIONS

Xin and Xout- These pins form an on-chip reference oscillator when connected to terminals of an external parallel resonant crystal of 14.31818 at 22 PF load. Xin may also serve as an input for an externally generated CMOS reference signal.

OE- Output enable. When OE is high, all clock outputs are enabled. When OE is low, all clock outputs are tristated. This input has internal pull-up resistor to VDD.

PCLK(1:4) - Low skew (<200pS) buffered outputs for host clocks. These outputs have 60mA switching currents at 3.3V.

BCLK(1:6) - Low skew (<250pS) buffered outputs for PCI clocks. These outputs have 60mA switching currents at 3.3v. They are synchronous and 2 nS (Typ) offset to PCLK.

24 MHz - 24 MHz SIO clock output

12 MHz - 12 MHz KBD clock output

REF0 and REF1 - 14.31818 MHz clock outputs.

S1 and S0- Frequency select inputs. These inputs select the frequency of the PCLK and BCLK outputs. Both have internal pull-down resistors to VSS.

VSS - Circuit grounds.

VDD- Positive power supplies.

AVSS- Analog circuit ground.

AVDD- Analog positive power supply. (3.3V)

MAXIMUM RATINGS

Voltage Relative to VSS	-0.3V
Voltage Relative to VDD	0.3V
Storage Temperature:	-65°C to +150°C
Ambient Temperature:	-0°C to + 70°C
Maximum Supply Voltage	7V

This device contains circuitry to protect the inputs against damage due to high static voltages or electric field; however, precautions should be taken to avoid application of any voltage higher than the maximum rated voltages to this circuit. For proper operation, Vin and Vout should be constrained to the range:

$$VSS < (Vin \text{ or } Vout) < VDD$$

Unused inputs must always be tied to an appropriate logic voltage level (either VSS or VDD).

APPLICATION DIAGRAM

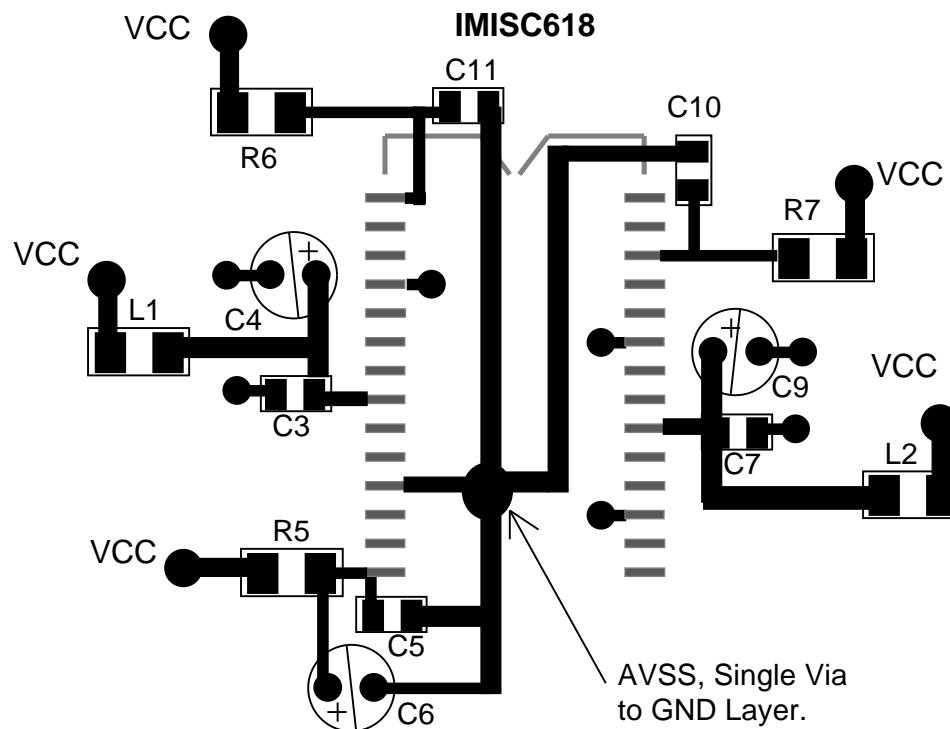

NOTE: IF VCC AT CLOCK GENERATOR CONTAINS POSITIVE VOLTAGE STEPS > OR -100 MV WITHIN 5 US (FROM TURNING DISK DRIVE OFF, ETC.), THE VALUES OF L1, C1, AND C2 SHOULD BE INCREASED APPROXIMATELY 100% TO AVOID OUT-OF-SPEC SHORT CLOCK CYCLES.

NOTE 1: C3, C5, C7, C8 MUST BE CLOSE TO THEIR VDD PINS.

NOTE 2: R6 AND R7 SHOULD BE PLACED WHEN USING OTHER THAN IMI CLOCK GENERATOR.

CMOS PLL**PCB LAYOUT SUGGESTION****NOTES**

- 1) This layout accommodates IMI technology while maintaining pin compatibility with other vendors' products designed to the Intel clock generator spec. R 6 = R7 = 1 (open) for IMI; R5 = R6 = 0 (closed) for other vendors. Note that jumpers may also be used instead of the resistor R6 and R7.
- 2) Separate top layer traces and filtering to AVDD and AVSS produce the best performance for IMI clock generators.
