

General Description

The ILC705/ILC706/ILC707/ILC708 are low cost microprocessor supervisory circuits that monitor power supplies in microprocessor based systems. Circuit functions include a watchdog timer, microprocessor reset, power failure warning and a debounced manual reset input.

The ILC705 and ILC706 offer a watchdog timer function while the ILC707 and ILC708 have an active high reset output in addition to the active low reset output.

Supply voltage monitor levels of 4.65V and 4.4V are available. The ILC705/ILC707 have a nominal reset threshold level of 4.65V while the ILC706 and ILC708 have a 4.4V nominal reset threshold level. When the supply voltage drops below the respective reset threshold level, RESET is asserted.

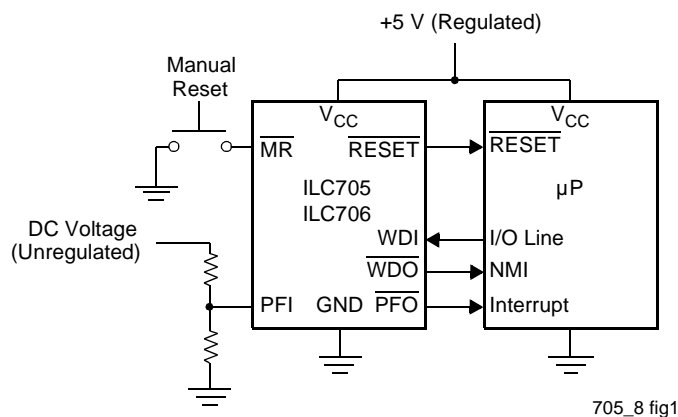

Features

- 4.4V or 4.65V Precision Voltage Monitor
- 200 ms Reset Pulse Width
- Debounced TTL/CMOS Compatible Manual Reset Input
- Watchdog Timer with 1.6 sec Timeout (ILC705/ILC706)
- Voltage Monitor for Early Power Fail Warning or Low Battery Detect
- 8-Pin SOIC or DIP Package

Applications

- Computers
- Controllers
- Critical Microprocessor Power Monitoring
- Intelligent Instruments
- Portable Equipment

Typical Circuit

Pin - Package Configurations

N Package - 8 Lead Plastic DIP Package
M Package - 8 Lead Plastic SOIC Package

Ordering Information

Part	Package	Temp. Range
ILC70_N	8-Lead PDIP	-40°C to +85°C
ILC70_M	8-Lead SOIC	-40°C to +85°C

705_8 tab 1

Absolute Maximum Ratings

705_8 tab 2

Parameter	Symbol	Ratings	Units
Terminal Voltage	V_{CC}	-0.3 to 6.0	V
	All other inputs	-0.3 to ($V_{CC} + 0.3$)	V
Input Current	V_{CC} GND	25	mA
Output Current	All outputs	20	mA
Operating Temperature Range	T_A	-40 to +85	$^{\circ}$ C
Storage Temperature Range		-65 to +150	$^{\circ}$ C
Lead Temperature (Soldering, 10 sec.)		300	$^{\circ}$ C
Power Dissipation	PDIP	475	mW
	SOIC	400	mW

Stresses above those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent device failure. Functionality at or above these limits is not implied. Exposure to absolute maximum ratings for extended periods may affect device reliability. Operating ranges define those limits between which the functionality of the device is guaranteed.

Electrical Characteristics

$V_{CC} = 4.75$ V to 5.5 V for ILC705/ILC707, $V_{CC} = 4.5$ V to 5.5 V for ILC706/ILC708, T_A = Operating Temperature Range, unless otherwise noted.

Parameter	Conditions	Min	Typ	Max	Units
Operating Voltage Range, V_{CC}	ILC70__	1.4		5.5	V

$\overline{\text{PFO}}$ Output Voltage	$I_{Sink} = 3.2 \text{ mA}$ $V_{CC} = 5 \text{ V}$, $I_{Source} = 800 \mu\text{A}$	$V_{CC} - 1.5 \text{ V}$		0.4	V

705_8 tab 3

Pin Functions

Pin Name	Pin Number		Description
	ILC705 ILC706	ILC707 ILC708	
$\overline{\text{MR}}$	1	1	Manual reset input. $\overline{\text{MR}}$ forces $\overline{\text{RESET}}$ to assert when pulled below 0.8V. An internal pull-up current of 250 mA on this input forces it high when left floating. This input can also be driven from TTL or CMOS logic.
V_{CC}	2	2	Power supply input, 5 V.
GND	3	3	Ground pin, 0 V reference.
PFI	4	4	Power fail input. Internally connected to the power fail comparator which is referenced to 1.25 V. The power fail output ($\overline{\text{PFO}}$) remains high if PFI is above 1.25 V. PFI should be connected to GND or V_{OUT} if the power fail comparator is not used.
$\overline{\text{PFO}}$	5	5	Power fail output. The power fail comparator is independent of all other functions on this device.
WDI	6	N/A	Watchdog input. The WDI input monitors microprocessor activity, an internal watchdog timer resets itself with each transition on the watchdog input. If the WDI pin is held high or low for longer than the watchdog timeout period, $\overline{\text{WDO}}$ is forced to active low. The watchdog function can be disabled by floating the WDI pin.
N/C	N/A	6	No Connect.
$\overline{\text{RESET}}$	7	7	$\overline{\text{RESET}}$ output. $\overline{\text{RESET}}$ is asserted if either V_{CC} goes below the reset threshold or by a low signal on the manual reset input ($\overline{\text{MR}}$). $\overline{\text{RESET}}$ remains asserted for one reset timeout period (200 ms) after V_{CC} exceeds the reset threshold or after the manual reset pin transitions from low to high. The watchdog timer will not assert $\overline{\text{RESET}}$ unless WDO is connected to $\overline{\text{MR}}$.
$\overline{\text{WDO}}$	8	N/A	Watchdog timer output. The watchdog timer resets itself with each transition on the watchdog input. If the WDI pin is held high or low for longer than the watchdog timeout period, $\overline{\text{WDO}}$ is forced low. $\overline{\text{WDO}}$ will also be forced low if V_{CC} is below the reset threshold and will remain low until V_{CC} returns to a valid level.
RESET	N/A	8	RESET output. RESET is the compliment of $\overline{\text{RESET}}$ and is asserted if either V_{CC} goes below the reset threshold or by a low signal on the manual reset input ($\overline{\text{MR}}$). RESET is suitable for microprocessors systems that use an active high reset.

705_8 tab 4

Circuit Description

Microprocessor Reset

The $\overline{\text{RESET}}$ pin is asserted whenever V_{CC} falls below the reset threshold voltage or when $\overline{\text{MR}}$ goes low. The reset pin remains asserted for a period of 200 ms after V_{CC} has risen above the reset threshold voltage and $\overline{\text{MR}}$ goes high. The reset function ensures the microprocessor is properly reset and powers up into a known condition after a power failure. $\overline{\text{RESET}}$ will remain valid with V_{CC} as low as 1.4 V.

Figure : Reset Timing Diagram

Watchdog Timer

The microprocessor can be monitored by connecting the WDI pin (watchdog input) to a bus line or I/O line. If a transition does not occur on the WDI pin within the watchdog timeout period, then $\overline{\text{WDO}}$ will go low. A minimum pulse of 50 ns or any transition low-to-high or high-to-low on the WDI pin will reset the watchdog timer. The output of the watchdog timer ($\overline{\text{WDO}}$) will remain high if WDI sees a valid transition within the watchdog timeout period or if WDI is left floating. If V_{CC} falls below the reset threshold voltage then $\overline{\text{WDO}}$ goes low immediately regardless of WDI. If WDI is left floating, then $\overline{\text{WDO}}$ can be used as a low line indicator.

Manual Reset

The manual-reset input ($\overline{\text{MR}}$) allows reset to be triggered by a pushbutton switch which is debounced by the 140 ms minimum reset pulse width. $\overline{\text{MR}}$ can be driven by external TTL/CMOS compatible logic. By connecting $\overline{\text{WDO}}$ to $\overline{\text{MR}}$ a watchdog timeout will generate a reset pulse in the ILC705/ILC706.

Power Fail Warning

An additional comparator which is independent of other functions on the ILC705/706/707/708 is provided for early warning of power failure. An external voltage divider can be used to compare unregulated DC to an internal 1.25 V reference. The voltage divider ratio on the input of the power fail comparator (PFI) can be chosen so as to trip the power fail

comparator a few milliseconds before V_{CC} falls below the maximum reset threshold voltage. The output of the power fail comparator (PFO) can be used to interrupt the microprocessor when used in this mode and execute shut-down procedures prior to power loss.

Devices sold by Impala Linear Corporation are covered by the warranty and patent indemnification provisions appearing in its Terms of Sale only. Impala Linear Corporation makes no warranty, express, statutory, implied, or by description regarding the information set forth herein or regarding the freedom of the described devices from patent infringement. Impala Linear Corporation makes no warranty of merchantability or fitness for any purpose. Impala Linear Corporation reserves the right to discontinue production and change specifications and prices at any time and without notice.

This product is intended for use in normal commercial applications. Applications requiring an extended temperature range, unusual environmental requirements, or high reliability applications, such as military and aerospace, are specifically not recommended without additional processing by Impala Linear Corporation.

Impala Linear Corporation assumes no responsibility for the use of any circuitry other than circuitry embodied in an Impala Linear Corporation product. No other circuits, patents, licenses are implied.

Life Support Policy

Impala Linear Corporation's products are not authorized for use as critical components in life support devices or systems.

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform, when properly used in accordance with instructions for use provided in the labelling, can be reasonably expected to result in a significant injury to the user.

2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
