GENERAL DESCRIPTION

The Samsung KMM372F213C is a 2Mx72bits Dynamic RAM high density memory module. The Samsung KMM372F213C consists of nine CMOS 2Mx8bits DRAMs in SOJ/TSOP-II 300mil package, and two 16bits driver IC in 48pin TSSOP package mounted on a 168-pin glass-epoxy substrate. A 0.1 or 0.22uF decoupling capacitor is mounted on the printed circuit board for each DRAM. PD Note : PD & ID Terminals must each be pulled up through a resister to V_{CC} at the next higher level assembly. PDs will be either open (NC) or driven to V_{SS} via on-board buffer circuits.

ID Note : IDs will be either open (NC) or connected directly to V_{SS} without a buffer.

NOTES

1. An initial pause of 200us is required after power-up followed by any 8 $\overline{RAS}$-only or $\overline{CAS}$-before-$\overline{RAS}$ refresh cycles before proper device operation is achieved.

2. Input voltage levels are Vih/Vil. V_{IH}(min) and V_{IL}(max) are reference levels for measuring timing of input signals. Transition times are measured between V_{IH}(min) and V_{IL}(max) and are assumed to be 5ns for all inputs.

3. Measured with a load equivalent to 1 TTL loads and 100pF. Voh=2.0V and Vol=0.8V.

4. Operation within the t_{RCD}(max) limit insures that t_{RAC}(max) can be met. t_{RCD}(max) is specified as a reference point only. If t_{RCD} is greater than the specified t_{RCD}(max) limit, then access time is controlled exclusively by t_{CAC}.

5. Assumes that $t_{RCD} \geq t_{RCD}$(max).

6. This parameter defines the time at which the output achieves the open circuit condition and is not referenced to V_{OH} or V_{OL}.

7. t_{WCS}, t_{RWD}, t_{CWD} and t_{AWD} are non restrictive operating parameter. They are included in the data sheet as electrical characteristics only. If $t_{WCS} \geq t_{WCS}$(min) the cycle is an early write cycle and the data out pin will remain high impedance for the duration of the cycle.

   If $t_{CWD} \geq t_{CWD}$(min), $t_{RWD} \geq t_{RWD}$(min) and $t_{AWD} \geq t_{AWD}$ (min), then the cycle is a read-write cycle and the data output will contain data read from the selected address. If neither of the above conditions are satisfied, the condition of the data out is indeterminated.

8. Either t_{RCH} or t_{RRH} must be satisfied for a read cycle.

9. These parameters are referenced to the $\overline{CAS}$ leading edge in early write cycles and to the $\overline{W}$ leading edge in read-write cycles.

10. Operation within the t_{RAD}(max) limit insures that t_{RAC}(max) can be met. t_{RAD}(max) is specified as reference point only. If t_{RAD} is greater than the specified t_{RAD}(max) limit, then access time is controlled by t_{AA}.

11. t_{CEZ}(max), t_{REZ}(max), t_{WEZ}(max) and t_{OEZ}(max) define the time at which the output achieves the open circuit condition and are not referenced to output voltage level.

12. If $\overline{RAS}$ goes to high before $\overline{CAS}$ high going, the open circuit condition of the output is achieved by $\overline{CAS}$ high going. If $\overline{CAS}$ goes to high before $\overline{RAS}$ high going , the open circuit condition of the output is achieved by $\overline{RAS}$ high going.

13. $t_{ASC} \geq t_{CP}$ min

14. The timing skew from the DRAM to the DIMM resulted from the addition of buffers.
