

DDR SDRAM Specification  
Version 0.73

## Revision History

### Version 0 (May, 1998)

- First version for internal review

### Version 0.1(June, 1998)

- Added x4 organization

### Version 0.2(Sep,1998)

1. Added "Issue prcharge command for all banks of the device" as the fourth step of power-up sequence.
2. In power down mode timing diagram, NOP condition is added to precharge power down exit.

### Version 0.3(Dec,1998)

- Added QFC Function.
- Added DC current value
- Reduce I/O capacitance values

### Version 0.4(Feb,1999)

- Added DDR SDRAM history for reference(refer to the following page)
- Added low power version DC spec

### Version 0.5(Apr,1999)

- Revised following first showing for JEDEC standard
- Added DC target current based on new DC test condition

### Version 0.6(July 1,1999)

- 1.Modified binning policy

From	To
-Z (133Mhz)	-Z (133Mhz/266Mbps@CL=2)
-8 (125Mhz)	-Y (133Mhz/266Mbps@CL=2.5)
-0 (100Mhz)	-0 (100Mhz/200Mbps@CL=2)

- 2.Modified the following AC spec values

	From.		To.		
	-Z	-0	-Z	-Y	-0
tAC	+/- 0.75ns	+/- 1ns	+/- 0.75ns	+/- 0.75ns	+/- 0.8ns
tDQSCK	+/- 0.75ns	+/- 1ns	+/- 0.75ns	+/- 0.75ns	+/- 0.8ns
tDQSQ	+/- 0.5ns	+/- 0.75ns	+/- 0.5ns	+/- 0.5ns	+/- 0.6ns
tDS/tDH	0.5 ns	0.75 ns	0.5 ns	0.5 ns	0.6 ns
tCDLR*1	2.5tCK-tDQSS	2.5tCK-tDQSS	1tCK	1tCK	1tCK
tPRE*1	1tCK +/- 0.75ns	1tCK +/- 1ns	0.9/1.1 tCK	0.9/1.1 tCK	0.9/1.1 tCK
tRPST*1	tCK/2 +/- 0.75ns	tCK/2 +/- 1ns	0.4/0.6 tCK	0.4/0.6 tCK	0.4/0.6 tCK
tHZQ*1	tCK/2 +/- 0.75ns	tCK/2 +/- 1ns	+/- 0.75ns	+/- 0.75ns	+/-0.8ns

\*1 : Changed description method for the same functionality. This means no difference from the previous version.

- 3.Changed the following AC parameter symbol

	From.	To.
Output data access time from CK/CK	tDQCK	tAC

### Version 0.61(August 9,1999)

- Changed the some values of "write with auto precharge" table for different bank in page 31.

Asserted command	For Different Bank			
	3		4	
	Old	New	Old	New
Read	Legal	Illegal	Legal	Illegal
Read + AP*1	Legal	Illegal	Legal	Illegal

# 128Mb DDR SDRAM

Preliminary

## Revision History(continued)

### Version 0.7 (March, 2000)

- Changed 128Mb spec from target to Preliminary version.
- Changed partnames as follows.

from	to
KM44L32031BT-G(L)Z/Y/0	K4H280438B-TC(L)A2/B0/A0
KM48L16031BT-G(L)Z/Y/0	K4H280838B-TC(L)A2/B0/A0
KM416L8031BT-G(L)Z/Y/0	K4H281638B-TC(L)A2/B0/A0

- Changed input cap. spec.

	from	to
CK/CK	2.5pF ~ 3.5pF	2.0pF ~ 3.0pF w/ Delta Cin = 0.25pF
DQ/DQS/DM	4.0pF ~ 5.5pF	4.0pF ~ 5.0pF w/ Delta Cin = 0.5pF
CMD/Addr	2.5pF ~ 3.5pF	2.0pF ~ 3.0pF with Delta Cin = 0.5pF

- Changed operating condition.

	from	to
Vil/Vih(ac)	Vref +/- 0.35V	Vref +/- 0.31V
V <sub>IL</sub> /V <sub>IH</sub> (dc)	Vref +/- 0.18V	Vref +/- 0.15V

- Added Overshoot/Undershoot spec
  - . Vih(max) = 4.2V, the overshoot voltage duration is ≤ 3ns at VDD.
  - . Vil(min) = -1.5V, the overshoot voltage duration is ≤ 3ns at VSS.

- Changed AC parameters as follows.

	from	to	Comments
tDQSQ	+/- 0.5(PC266), +/- 0.6(PC200)	+0.5(PC266), +0.6(PC200)	
tDV	+/- 0.35tCK	-	Removed
tQH	-	tHPmin - 0.75ns(PC266) tHPmin - 1.0ns(PC200)	New Definition
tHP	-	tCLmin or tCHmin	New Definition

- Added DC spec values.

### Version 0.71 (April, 2000)

- Corrected a typo for tRAS at 133Mhz/CL2.5 from 48ns to 45ns.
- Corrected a typo in "General Information" table from 64Mx4 to 8Mx16.

### Version 0.72(May,2000)

- Changed DC spec item & test condition

### Version 0.73(June,2000)

- Added updated DC spec values
- Deleted tDAL in AC parameter

## Revision History

-This revision history is for 64Mb and only for reference in other density.

### Version 0.5 (JUN, 1997)

- First version for external release
- Center aligned DQ on reads and writes, 3.3V Vdd/Vddq, LVTTTL for command and SSTL for DQ, DQS, CK and DM.

### Version 0.6 (SEP. 1997)

- Changed to Edge aligned DQ on reads
- Add detailed discription for each functionality

### Version 0.7 (JAN. 1998)

- Power supply: 3.3V +10%, -5% power supply for device operation (Vdd)  
2.5V Power supply for I/O interface (Vddq)
- Interface: Add SSTL\_2 for CK/DM (class I), DQ/DQS(class II) for KM416H431T.  
\* Put two part numbers, KM416H430T and KM416H431T.
- Clock input: Change to differential clock from single ended clock.  
\* Use CK,  $\overline{CK}$  instead of CLK.
- Package: Change to 66pin TSOP-II, instead of 54pin TSOP-II
- tDQSS: Change to 0.75 ~ 1.25 tCK form 3ns ~ 1 tCK.  
Add tSDQS(DQS-in setup time)
- In page 13, "DM can be ~" is modified to "DM must be ~".
- Tighten AC specs Change CK/CK hign/low level width from 0.4(min)/0.6(max)tCK to 0.45(min)/0.55(max)tCK.  
-> Better input clock duty ratio from differential clock.

### Version 0.8 (FEB. 1998)

- Correct pin rotation on pin 48 and 49 from 48-Vref, 49-Vss to 48-Vss, 49-Vref.

### Version 0.9 (MAR. 1998)

- Change power-up sequence
  - . Add EMRS for DLL enable/disable
  - . Change DLL reset pin from A9 to A8 on MRS.
- Change speed range
  - . Add 133Mhz (266Mbps/pin), remove -12 (83Mhz)
- Change output load circuit
- Change input capacitance
- Add a comment on read interrupting write timing: Read command interrupting write can not be issued at the next clock edge of write command.
- Modify the simplified state diagram on page 24.

### Version 0.91 (May, 1998)

- Changed part number from KM416H430T/KM416H431T to KM416H4030T/KM416H4031T
- Added the 66pin package dimension on page 30.
- Changed Output Load Circuit 2 in page 29
- Removed CL=1.5
- Corrected typos

32 : x32

### 6. Bank

3 : 4 Bank

### 7. Interface (VDD & VDDQ)

8: SSTL-2(2.5V, 2.5V)

### 8. Version

M : 1st Generation

A : 2nd Generation

B : 3rd Generation

C : 4th Generation

D : 5th Generation

E : 6th Generation

### 9. Package

T : TSOP2 (400mil x 875mil)

### 10. Temperature & Power

C : (Commercial, Normal)

L : (Commercial, Low)

### 11. Speed

A0 : 10ns@CL2

A2 : 7.5ns@CL2

B0 : 7.5ns@CL2.5

## 1. Key Features

### 1.1 Features

- Double-data-rate architecture; two data transfers per clock cycle
- Bidirectional data strobe(DQS)
- Four banks operation
- Differential clock inputs(CK and  $\overline{\text{CK}}$ )
- DLL aligns DQ and DQS transition with CK transition
- MRS cycle with address key programs
  - Read latency 2, 2.5 (clock)
  - Burst length (2, 4, 8)
  - Burst type (sequential & interleave)
- All inputs except data & DM are sampled at the positive going edge of the system clock(CK)
- Data I/O transactions on both edges of data strobe
- Edge aligned data output, center aligned data input
- LDM,UDM/DM for write masking only
- Auto & Self refresh
- 15.6us refresh interval(4K/64ms refresh)
- Maximum burst refresh cycle : 8
- 66pin TSOP II package

### 1.2 Operating Frequencies

	- A2	- B0	- A0
Speed	133MHz@CL2	133MHz@CL2.5	100MHz@CL2
DLL jitter	$\pm 0.75\text{ns}$	$\pm 0.75\text{ns}$	$\pm 0.8\text{ns}$

\*CL : Cas Latency

**Table 1. Operating frequency and DLL jitter**

# 128Mb DDR SDRAM

Preliminary

## 1. Package Pinout & Dimension

### 2.1 Package Pinout

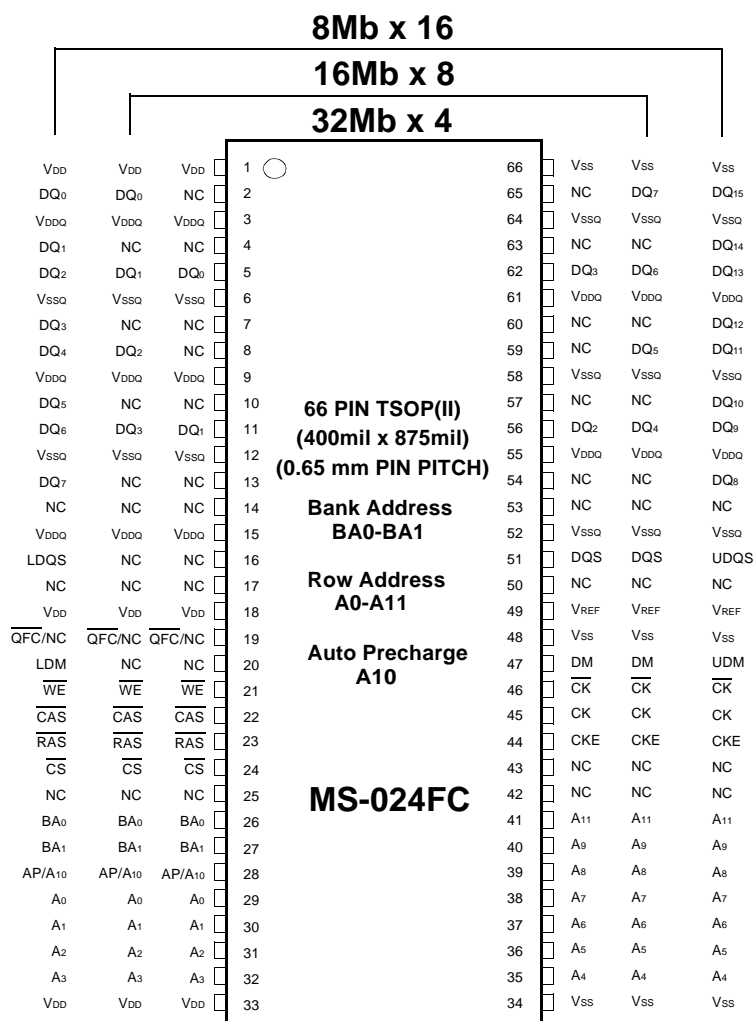

Figure 1. 128Mb package Pinout

Organization	Column Address
32Mx4	A0-A9, A11
16Mx8	A0-A9
8Mx16	A0-A8

DM is internally loaded to match DQ and DQS identically.

Table 2. Column address configuration

## 2.2 Input/Output Function Description

SYMBOL	TYPE	DESCRIPTION
CK, $\overline{\text{CK}}$	Input	Clock : CK and $\overline{\text{CK}}$ are differential clock inputs. All address and control input signals are sampled on the positive edge of CK/negative edge of $\overline{\text{CK}}$ . Output (read) data is referenced to both edges of CK. Internal clock signals are derived from CK/ $\overline{\text{CK}}$ .
CKE	Input	Clock Enable : CKE HIGH activates, and CKE LOW deactivates internal clock signals, and device input buffers and output drivers. Deactivating the clock provides PRECHARGE POWER-DOWN and SELF REFRESH operation (all banks idle), or ACTIVE POWER-DOWN (row ACTIVE in any bank). CKE is synchronous for all functions except for disabling outputs, which is achieved asynchronously. Input buffers, excluding CK, $\overline{\text{CK}}$ and CKE are disabled during power-down and self refresh modes, providing low standby power. CKE will recognize an LVCMOS LOW level prior to VREF being stable on power-up.
$\overline{\text{CS}}$	Input	Chip Select : $\overline{\text{CS}}$ enables(registered LOW) and disables(registered HIGH) the command decoder. All commands are masked when $\overline{\text{CS}}$ is registered HIGH. $\overline{\text{CS}}$ provides for external bank selection on systems with multiple banks $\overline{\text{CS}}$ is considered part of the command code.
$\overline{\text{RAS}}$ , $\overline{\text{CAS}}$ , $\overline{\text{WE}}$	Input	Command Inputs : $\overline{\text{RAS}}$ , $\overline{\text{CAS}}$ and $\overline{\text{WE}}$ (along with $\overline{\text{CS}}$ ) define the command being entered.
LDM,(U)DM	Input	Input Data Mask : DM is an input mask signal for write data. Input data is masked when DM is sampled HIGH along with that input data during a WRITE access. DM is sampled on both edges of DQS. DM pins include dummy loading internally, to matches the DQ and DQS loading. For the x16, LDM corresponds to the data on DQ0-DQ7 ; UDM corresponds to the data on DQ8-DQ15.
BA0, BA1	Input	Bank Address Inputs : BA0 and BA1 define to which bank ACTIVE, READ, WRITE or PRECHARGE command is being applied.
A [n : 0]	Input	Address Inputs : Provide the row address for ACTIVE commands, the column address and AUTO PRECHARGE bit for READ/WRITE commands, to select one location out of the memory array in the respective bank. A10 is sampled during a PRECHARGE command to determine whether the PRECHARGE applies to one bank (A10 LOW) or all banks (A10 HIGH). If only one bank is to be precharged, the bank is selected by BA0, BA1. The address inputs also provide the op-code during a MODE REGISTER SET command. BA0 and BA1 define which mode register is loaded during the MODE REGISTER SET command (MRS or EMRS).
DQ	I/O	Data Input/Output : Data bus
LDQS,(U)DQS	I/O	Data Strobe : Output with read data, input with write data. Edge-aligned with read data, centered in write data. Used to capture write data. For the x16, LDQS corresponds to the data on DQ0-DQ7 ; UDQS corresponds to the data on DQ8-DQ15.
$\overline{\text{QFC}}$	Output	FET Control : Optional. Output during every Read and Write access. Can be used to control isolation switches on modules.
NC	-	No Connect : No internal electrical connection is present.
V <sub>DDQ</sub>	Supply	DQ Power Supply : +2.5V $\pm$ 0.2V.
V <sub>SSQ</sub>	Supply	DQ Ground.
V <sub>DD</sub>	Supply	Power Supply : One of +3.3V $\pm$ 0.3V or +2.5V $\pm$ 0.2V (device specific).
V <sub>SS</sub>	Supply	Ground.
V <sub>REF</sub>	Input	SSTL_2 reference voltage.

**Table 3. Input/Output Function Description**

## 2.3 66 Pin TSOP(II)/MS-024FC Package Physical Dimension

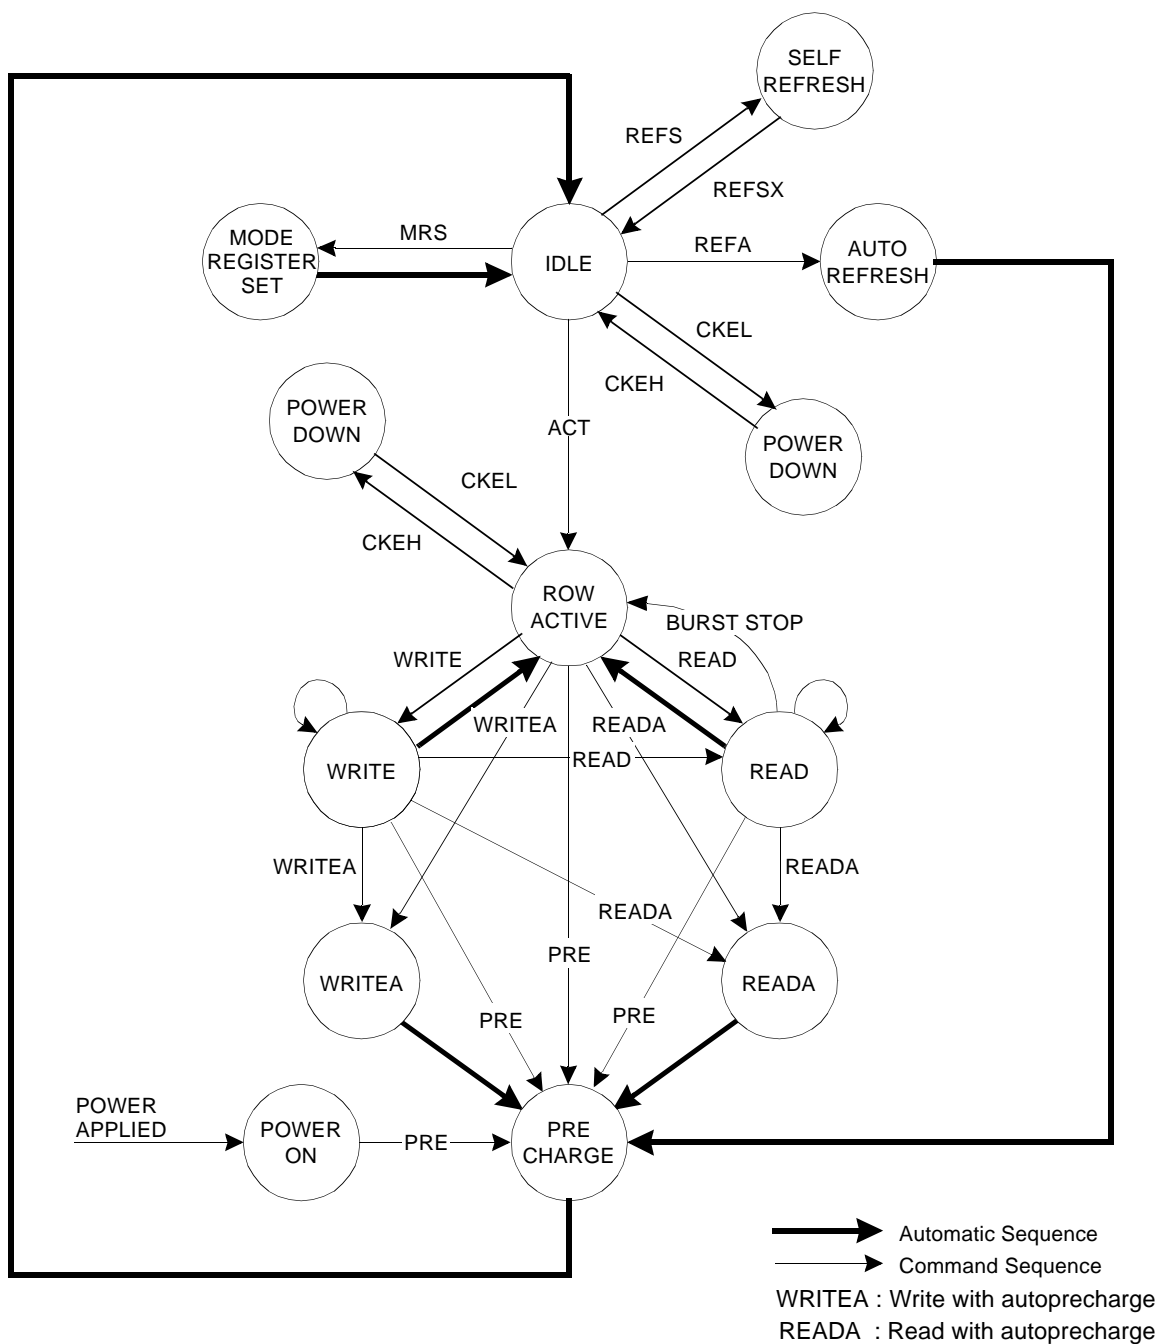

Figure 2. Package dimension

### 3. Functional Description

### 3.1 Simplified State Diagram

**Figure 3. State diagram**

## 3.2 Basic Functionality

### 3.2.1 Power-Up and Initialization Sequence

The following sequence is required for POWER UP and Initialization.

1. Apply power and attempt to maintain CKE at a low state(all other inputs may be undefined.)
  - Apply VDD before or at the same time as VDDQ.
  - Apply VDDQ before or at the same time as VTT & Vref.
2. Start clock and maintain stable condition for a minimum of 200us.
3. The minimum of 200us after stable power and clock(CK,  $\overline{\text{CK}}$ ), apply NOP & take CKE high.
4. Issue precharge commands for all banks of the device.
- \*1 5. Issue EMRS to enable DLL.(To issue "DLL Enable" command, provide "Low" to A0, "High" to BA0 and "Low" to all of the rest address pins, A1~A11 and BA1)
- \*1 6. Issue a mode register set command for "DLL reset". The additional 200 cycles of clock input is required to lock the DLL.  
(To issue DLL reset command, provide "High" to A8 and "Low" to BA0)
- \*2 7. Issue precharge commands for all banks of the device.
8. Issue 2 or more auto-refresh commands.
9. Issue a mode register set command with low to A8 to initialize device operation.

\*1 Every "DLL enable" command resets DLL. Therefore sequence 6 can be skipped during power up. Instead of it, the additional 200 cycles of clock input is required to lock the DLL after enabling DLL.

\*2 Sequence of 6 & 7 is regardless of the order.

Figure 4. Power up and initialization sequence

## 3.2.2 Mode Register Definition

### 3.2.2.1 Mode Register Set(MRS)

The mode register stores the data for controlling the various operating modes of DDR SDRAM. It programs CAS latency, addressing mode, burst length, test mode, DLL reset and various vendor specific options to make DDR SDRAM useful for variety of different applications. The default value of the mode register is not defined, therefore the mode register must be written after EMRS setting for proper DDR SDRAM operation. The mode register is written by asserting low on  $\overline{CS}$ ,  $\overline{RAS}$ ,  $\overline{CAS}$ ,  $\overline{WE}$  and BA0(The DDR SDRAM should be in all bank pre-charge with CKE already high prior to writing into the mode register). The states of address pins A0 ~ A11 in the same cycle as  $\overline{CS}$ ,  $\overline{RAS}$ ,  $\overline{CAS}$ ,  $\overline{WE}$  and BA0 going low are written in the mode register. Two clock cycles are requested to complete the write operation in the mode register. The mode register contents can be changed using the same command and clock cycle requirements during operation as long as all banks are in the idle state. The mode register is divided into various fields depending on functionality. The burst length uses A0 ~ A2, addressing mode uses A3, CAS latency(read latency from column address) uses A4 ~ A6. A7 is used for test mode. A8 is used for DLL reset. A7 must be set to low for normal MRS operation. Refer to the table for specific codes for various burst lengths, addressing modes and CAS latencies.

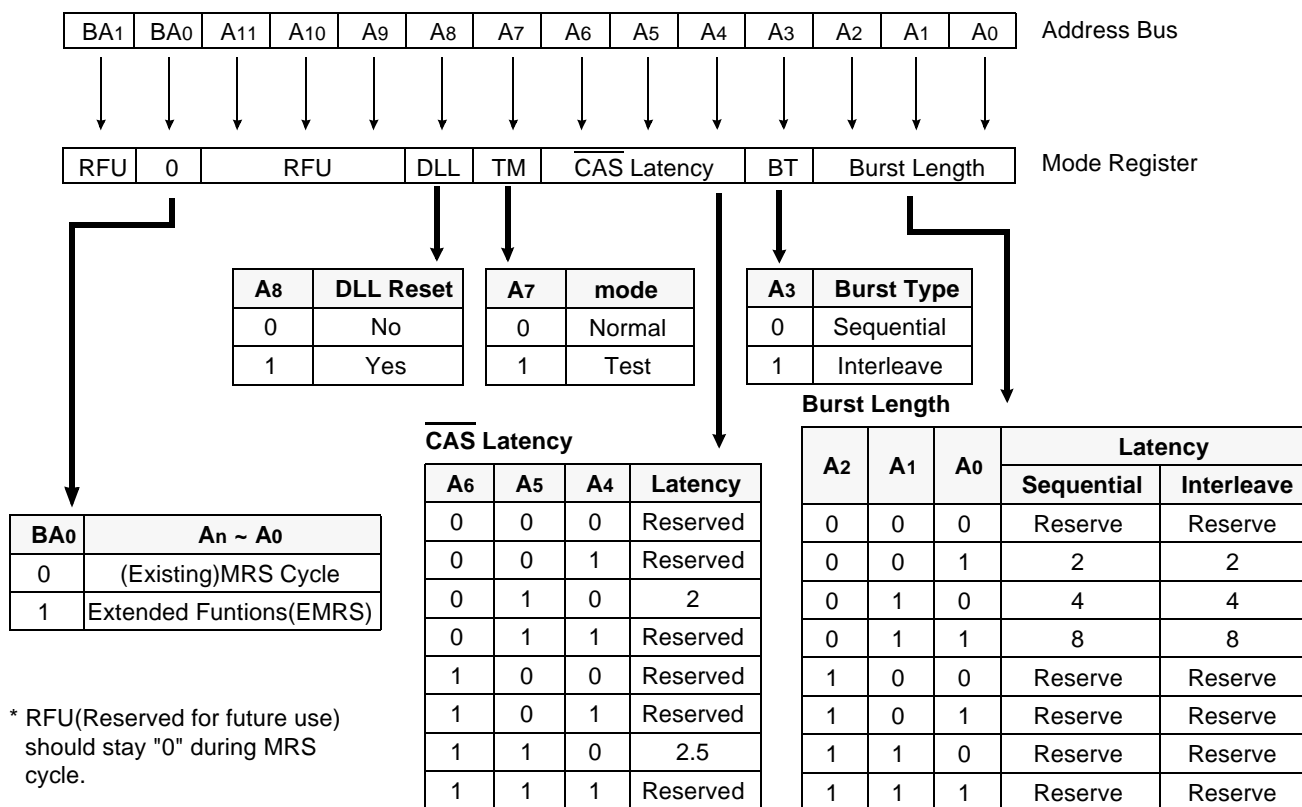

Figure 5. Mode Register Set

Burst Address Ordering for Burst Length

Burst Length	Starting Address(A2, A1, A0)	Sequential Mode	Interleave Mode
2	xx0	0, 1	0, 1
	xx1	1, 0	1, 0
4	x00	0, 1, 2, 3	0, 1, 2, 3
	x01	1, 2, 3, 0	1, 0, 3, 2
	x10	2, 3, 0, 1	2, 3, 0, 1
	x11	3, 0, 1, 2	3, 2, 1, 0
8	000	0, 1, 2, 3, 4, 5, 6, 7	0, 1, 2, 3, 4, 5, 6, 7
	001	1, 2, 3, 4, 5, 6, 7, 0	1, 0, 3, 2, 5, 4, 7, 6
	010	2, 3, 4, 5, 6, 7, 0, 1	2, 3, 0, 1, 6, 7, 4, 5
	011	3, 4, 5, 6, 7, 0, 1, 2	3, 2, 1, 0, 7, 6, 5, 4
	100	4, 5, 6, 7, 0, 1, 2, 3	4, 5, 6, 7, 0, 1, 2, 3
	101	5, 6, 7, 0, 1, 2, 3, 4	5, 4, 7, 6, 1, 0, 3, 2
	110	6, 7, 0, 1, 2, 3, 4, 5	6, 7, 4, 5, 2, 3, 0, 1
	111	7, 0, 1, 2, 3, 4, 5, 6	7, 6, 5, 4, 3, 2, 1, 0

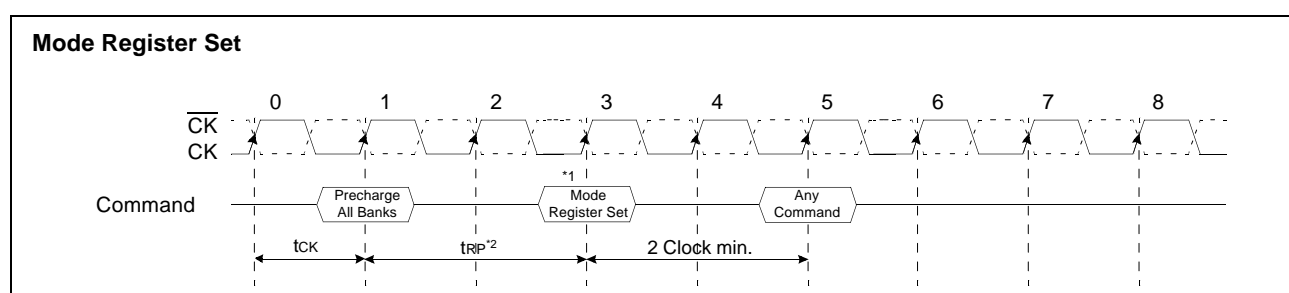

**Table 4. Burst address ordering for burst length**

## DLL Enable/Disable

The DLL must be enabled for normal operation. DLL enable is required during power-up initialization, and upon returning to normal operation after having disabled the DLL for the purpose of debug or evaluation (upon exiting Self Refresh Mode, the DLL is enabled automatically). Any time the DLL is enabled, 200 clock cycles must occur before a READ command can be issued.

## Output Drive Strength

The normal drive strength for all outputs is specified to be SSTL\_2, Class II. Some vendors might also support a weak driver strength option, intended for lighter load and/or point-to-point environments. I-V curves for the normal drive strength and weak drive strength will be included in a future revision of this document.

\*1 : MRS can be issued only at all bank precharge state.

\*2 : Minimum  $trp$  is required to issue MRS command.

**Figure 6. Mode Register Set sequence**

## 3.2.2.2 Extended Mode Register Set(EMRS)

The extended mode register stores the data for enabling or disabling DLL,  $\overline{QFC}$  and selecting output driver size. The default value of the extended mode register is not defined, therefore the extended mode register must be written after power up for enabling or disabling DLL. The extended mode register is written by asserting low on CS, RAS, CAS, WE and high on BA0(The DDR SDRAM should be in all bank precharge with CKE already high prior to writing into the extended mode register). The state of address pins A0 ~ A11 and BA1 in the same cycle as CS, RAS, CAS and WE going low are written in the extended mode register. Two clock cycles are required to complete the write operation in the extended mode register. The mode register contents can be changed using the same command and clock cycle requirements during operation as long as all banks are in the idle state. A0 is used for DLL enable or disable. "High" on BA0 is used for EMRS. All the other address pins except A0 and BA0 must be set to low for proper EMRS operation. Refer to the table for specific codes.

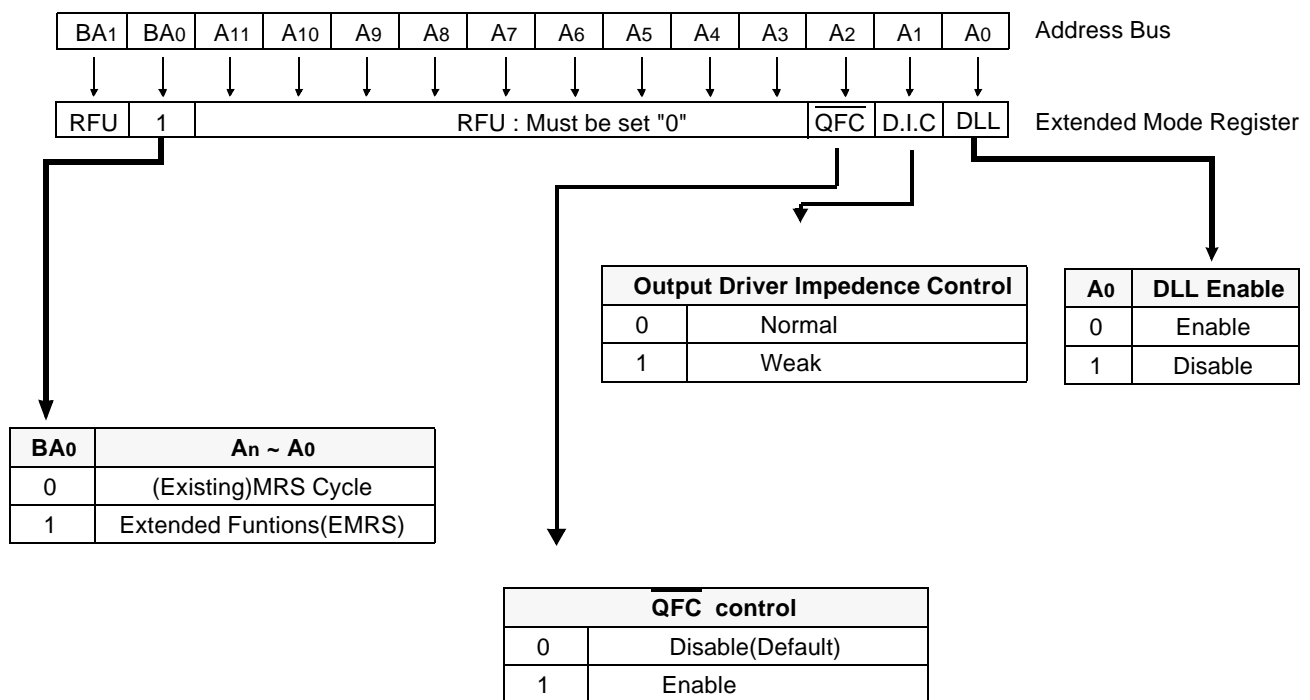

Figure 7. Extend Mode Register set

## 3.2.3 Precharge

The precharge command is used to precharge or close a bank that has been activated. The precharge command is issued when  $\overline{\text{CS}}$ ,  $\overline{\text{RAS}}$  and  $\overline{\text{WE}}$  are low and  $\overline{\text{CAS}}$  is high at the rising edge of the clock. The precharge command can be used to precharge each bank respectively or all banks simultaneously. The bank select addresses(BA0, BA1) are used to define which bank is precharged when the command is initiated. For write cycle,  $t_{\text{WR}}(\text{min.})$  must be satisfied until the precharge command can be issued. After  $t_{\text{RP}}$  from the precharge, an active command to the same bank can be initiated.

Bank Selection for Precharge by Bank address bits

A10/AP	BA1	BA0	Precharge
0	0	0	Bank A Only
0	0	1	Bank B Only
0	1	0	Bank C Only
0	1	1	Bank D Only
1	X	X	All Banks

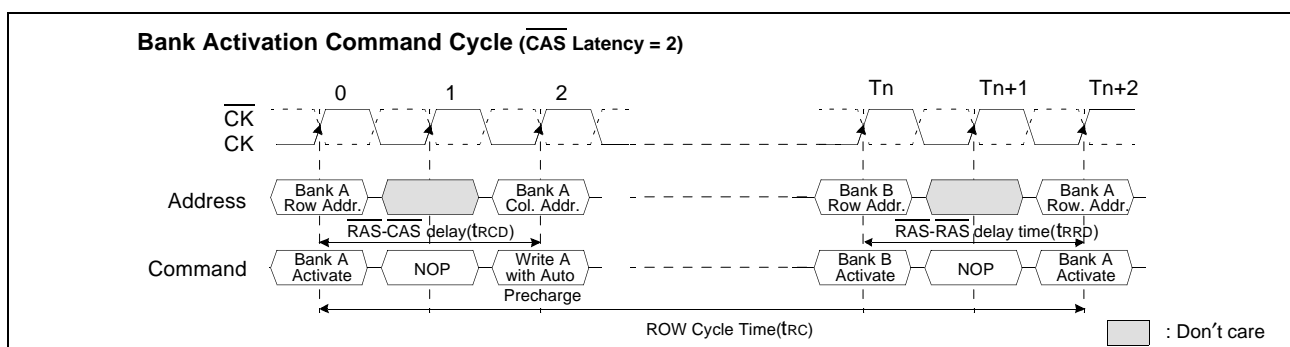

Table 5. Bank selection for precharge by Bank address bits

## 3.2.4 No Operation(NOP) & Device Deselect

The device should be deselected by deactivating the  $\overline{\text{CS}}$  signal. In this mode DDR SDRAM should ignore all the control inputs. The DDR SDRAMs are put in NOP mode when  $\overline{\text{CS}}$  is active and by deactivating  $\overline{\text{RAS}}$ ,  $\overline{\text{CAS}}$  and  $\overline{\text{WE}}$ . For both Deselect and NOP the device should finish the current operation when this command is issued.

## 3.2.5 Row Active

The Bank Activation command is issued by holding  $\overline{\text{CAS}}$  and  $\overline{\text{WE}}$  high with  $\overline{\text{CS}}$  and  $\overline{\text{RAS}}$  low at the rising edge of the clock (CK). The DDR SDRAM has four independent banks, so two Bank Select addresses (BA0, BA1) are required. The Bank Activation command must be applied before any Read or Write operation is executed. The delay from the Bank Activation command to the first read or write command must meet or exceed the minimum of RAS to CAS delay time ( $t_{\text{RCD min}}$ ). Once a bank has been activated, it must be precharged before another Bank Activation command can be applied to the same bank. The minimum time interval between interleaved Bank Activation commands (Bank A to Bank B and vice versa) is the Bank to Bank delay time ( $t_{\text{RRD min}}$ ).

**Figure 8. Bank activation command cycle timing**

## 3.2.6 Read Bank

This command is used after the row activate command to initiate the burst read of data. The read command is initiated by activating  $\overline{\text{RAS}}$ ,  $\overline{\text{CS}}$ ,  $\overline{\text{CAS}}$ , and deasserting  $\overline{\text{WE}}$  at the same clock sampling (rising) edge as described in the command truth table. The length of the burst and the CAS latency time will be determined by the values programmed during the MRS command.

## 3.2.7 Write Bank

This command is used after the row activate command to initiate the burst write of data. The write command is initiated by activating  $\overline{\text{RAS}}$ ,  $\overline{\text{CS}}$ ,  $\overline{\text{CAS}}$ , and  $\overline{\text{WE}}$  at the same clock sampling (rising) edge as described in the command truth table. The length of the burst will be determined by the values programmed during the MRS command.

## 3.3 Essential Functionality for DDR SDRAM

The essential functionality that is required for the DDR SDRAM device is described in this chapter

### 3.3.1 Burst Read Operation

Burst Read operation in DDR SDRAM is in the same manner as the current SDRAM such that the Burst read command is issued by asserting  $\overline{CS}$  and  $\overline{CAS}$  low while holding  $\overline{RAS}$  and  $\overline{WE}$  high at the rising edge of the clock(CK) after  $t_{RCD}$  from the bank activation. The address inputs (A0~A9) determine the starting address for the Burst. The Mode Register sets type of burst(Sequential or Interleave) and burst length(2, 4, 8). The first output data is available after the  $\overline{CAS}$  Latency from the READ command, and the consecutive data are presented on the falling and rising edge of Data Strobe(DQS) adopted by DDR SDRAM until the burst length is completed.

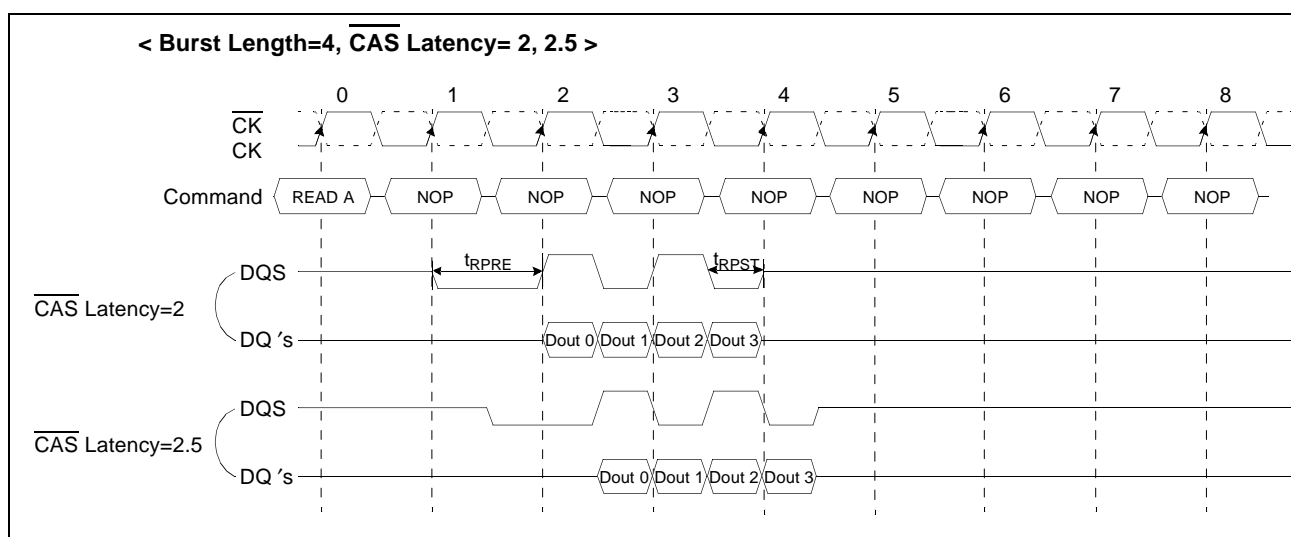

Figure 9. Burst read operation timing

## 3.3.2 Burst Write Operation

The Burst Write command is issued by having  $\overline{CS}$ ,  $\overline{CAS}$ , and  $\overline{WE}$  low while holding  $\overline{RAS}$  high at the rising edge of the clock(CK). The address inputs determine the starting column address. There is no write latency relative to DQS required for burst write cycle. The first data of a burst write cycle must be applied on the DQ pins  $t_{DS}$ (Data-in setup time) prior to data strobe edge enabled after  $t_{DQSS}$  from the rising edge of the clock(CK) that the write command is issued. The remaining data inputs must be supplied on each subsequent falling and rising edge of Data Strobe until the burst length is completed. When the burst has been finished, any additional data supplied to the DQ pins will be ignored.

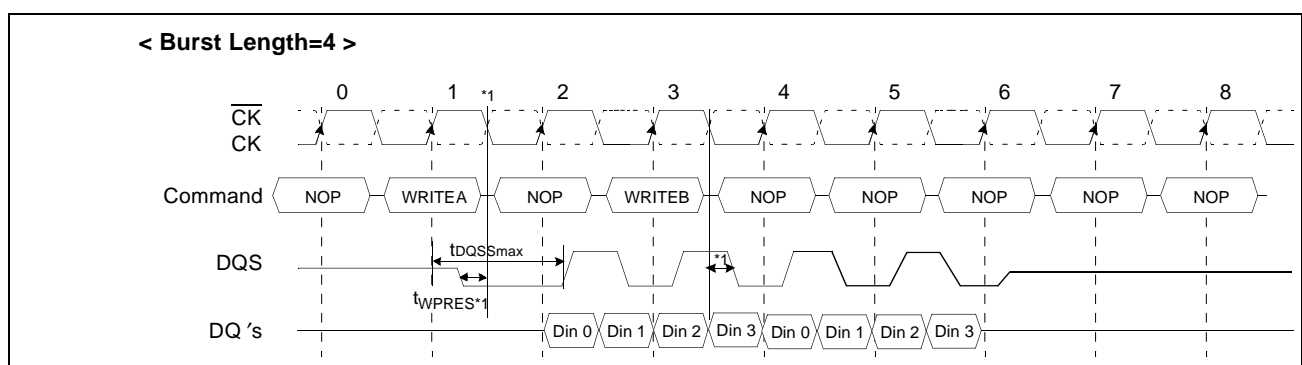

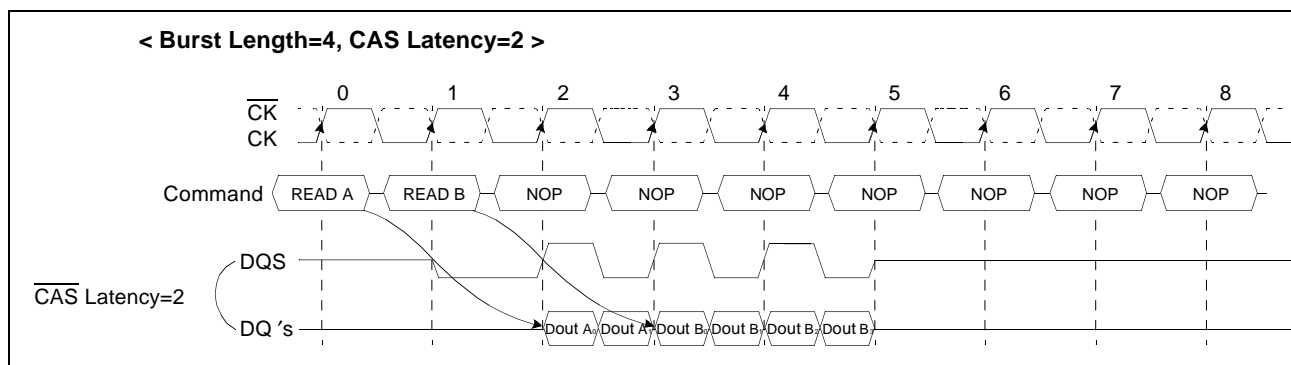

Figure 10. Burst write operation timing

1. The specific requirement is that DQS be valid(High or Low) on or before this CK edge. The case shown (DQS going from High\_Z to logic Low) applies when no writes were previously in progress on the bus. If a previous write was in progress, DQS could be High at this time, depending on  $t_{DQSS}$ .

## 3.3.3 Read Interrupted by a Read

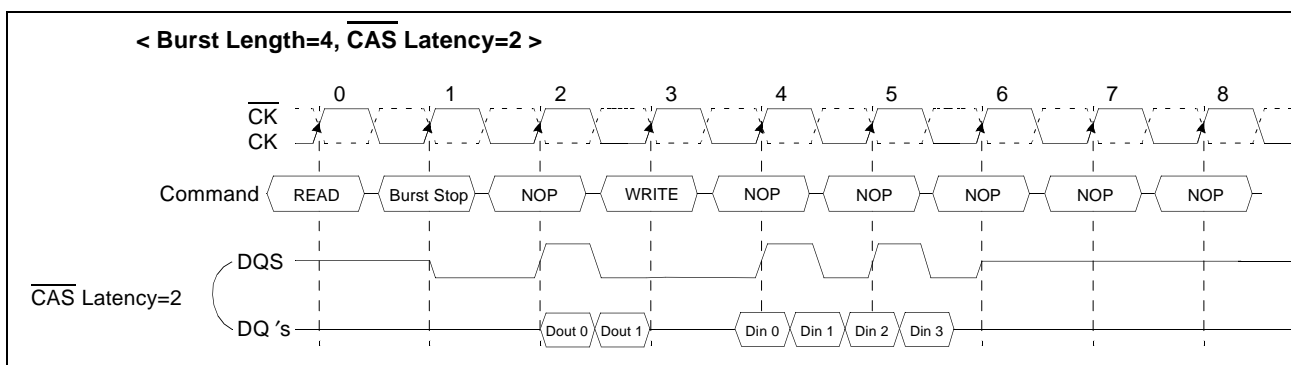

A Burst Read can be interrupted before completion of the burst by new Read command of any bank. When the previous burst is interrupted, the remaining addresses are overridden by the new address with the full burst length. The data from the first Read command continues to appear on the outputs until the CAS latency from the interrupting Read command is satisfied. At this point the data from the interrupting Read command appears. Read to Read interval is minimum 1 Clock.

**Figure 11. Read interrupted by a read timing**

## 3.3.4 Read Interrupted by a Write & Burst Stop

To interrupt a burst read with a write command, Burst Stop command must be asserted to avoid data contention on the I/O bus by placing the DQ's (Output drivers) in a high impedance state. To insure the DQ's are tri-stated one cycle before the beginning the write operation, Burst stop command must be applied at least 2 clock cycles for CL=2 and at least 3 clock cycles for CL=2.5 before the Write command.

**Figure 12. Read interrupted by a write and burst stop timing.**

The following functionality establishes how a Write command may interrupt a Read burst.

1. For Write commands interrupting a Read burst, a Burst Terminate command is required to stop the read burst and tristate the DQ bus prior to valid input write data. Once the Burst Terminate command has been issued, the minimum delay to a Write command = RU(CL) [CL is the CAS Latency and RU means round up to the nearest integer].
2. It is illegal for a Write command to interrupt a Read with autoprecharge command.

## 3.3.5 Read Interrupted by a Precharge

A Burst Read operation can be interrupted by precharge of the same bank. The minimum 1 clock is required for the read to precharge intervals. A precharge command to output disable latency is equivalent to the CAS latency.

**Figure 13. Read interrupted by a precharge timing**

When a burst Read command is issued to a DDR SDRAM, a Precharge command may be issued to the same bank before the Read burst is complete. The following functionality determines when a Precharge command may be given during a Read burst and when a new Bank Activate command may be issued to the same bank.

1. For the earliest possible Precharge command without interrupting a Read burst, the Precharge command may be given on the rising clock edge which is CL clock cycles before the end of the Read burst where CL is the CAS Latency. A new Bank Activate command may be issued to the same bank after tRP (RAS Precharge time).
2. When a Precharge command interrupts a Read burst operation, the Precharge command may be given on the rising clock edge which is CL clock cycles before the last data from the interrupted Read burst where CL is the CAS Latency. Once the last data word has been output, the output buffers are tristated. A new Bank Activate command may be issued to the same bank after tRP.
3. For a Read with autoprecharge command, a new Bank Activate command may be issued to the same bank after tRP where tRP begins on the rising clock edge which is CL clock cycles before the end of the Read burst where CL is the CAS Latency. During Read with autoprecharge, the initiation of the internal precharge occurs at the same time as the earliest possible external Precharge command would initiate a precharge operation without interrupting the Read burst as described in 1 above.
4. For all cases above, tRP is an analog delay that needs to be converted into clock cycles. The number of clock cycles between a Precharge command and a new Bank Activate command to the same bank equals tRP/tCK (where tCK is the clock cycle time) with the result rounded up to the nearest integer number of clock cycles. (Note that rounding to X.5 is not possible since the Precharge and Bank Activate commands can only be given on a rising clock edge).

In all cases, a Precharge operation cannot be initiated unless tRAS(min) [minimum Bank Activate to Precharge time] has been satisfied. This includes Read with autoprecharge commands where tRAS(min) must still be satisfied such that a Read with autoprecharge command has the same timing as a Read command followed by the earliest possible Precharge command which does not interrupt the burst.

## 3.3.6 Write Interrupted by a Write

A Burst Write can be interrupted before completion of the burst by a new Write command, with the only restriction that the interval that separates the commands must be at least one clock cycle. When the previous burst is interrupted, the remaining addresses are overridden by the new address and data will be written into the device until the programmed burst length is satisfied.

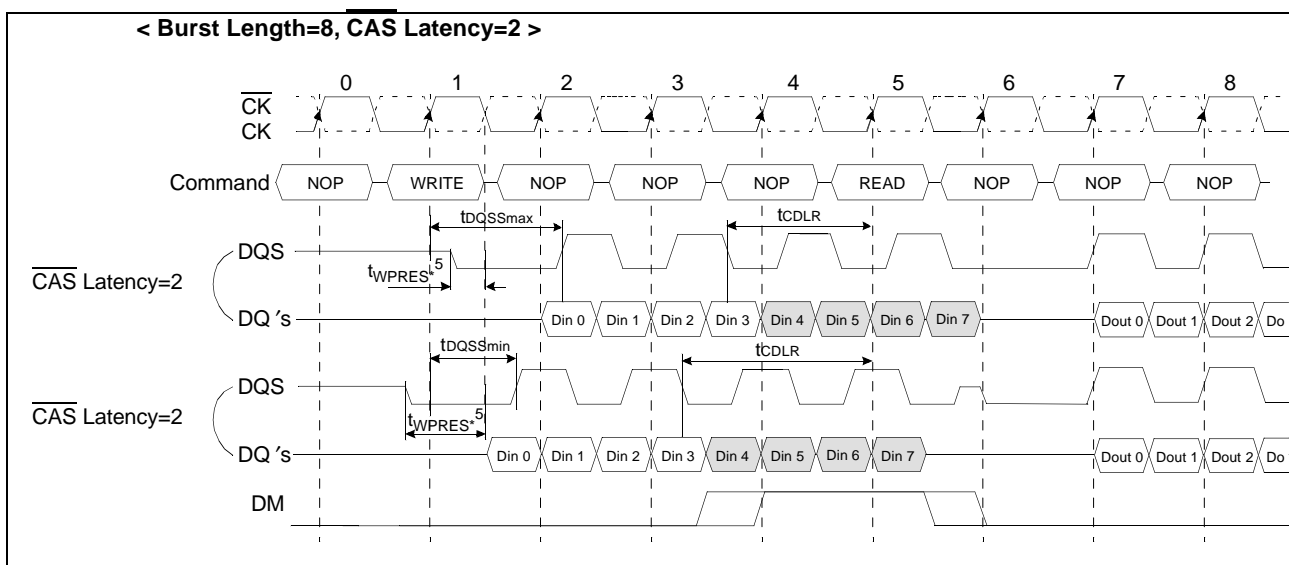

Figure 14. Write interrupted by a write timing

## 3.3.7 Write Interrupted by a Read & DM

A burst write can be interrupted by a read command of any bank. The DQ's must be in the high impedance state at least one clock cycle before the interrupting read data appear on the outputs to avoid data contention. When the read command is registered, any residual data from the burst write cycle must be masked by DM. The delay from the last data to read command ( $t_{CDLR}$ ) is required to avoid the data contention DRAM inside. Data that are presented on the DQ pins before the read command is initiated will actually be written to the memory. Read command interrupting write can not be issued at the next clock edge of that of write command.

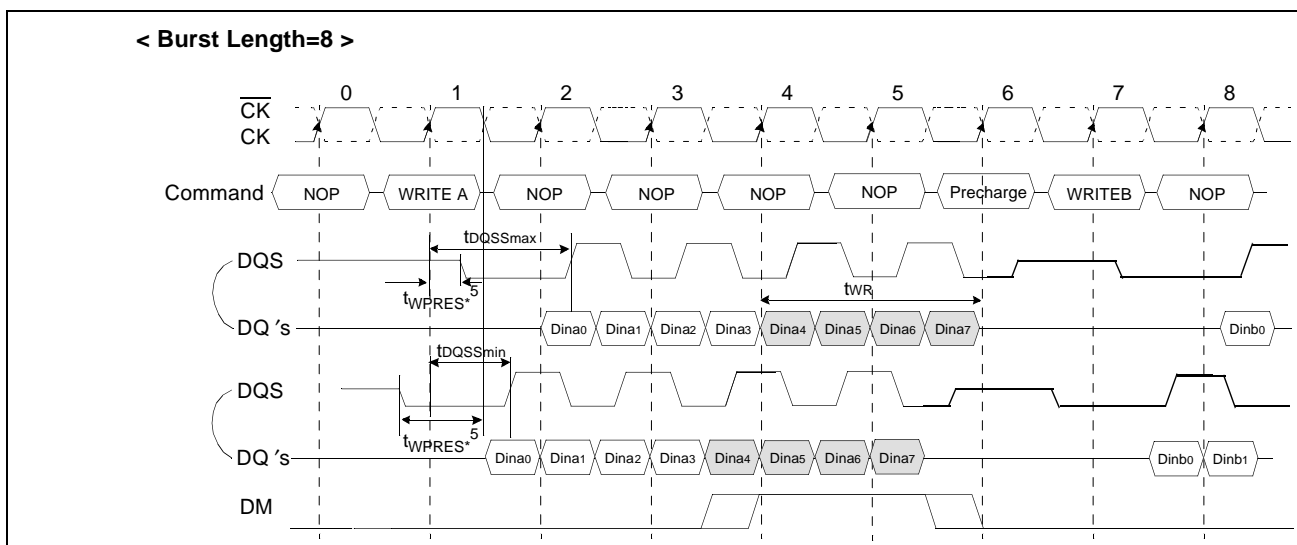

**Figure 15. Write interrupted by a read and DM timing**

The following function established how a Read command may interrupt a Write burst and which input data is not written into the memory.

1. For Read commands interrupting a Write burst, the minimum Write to Read command delay is 2 clock cycles. The case where the Write to Read delay is 1 clock cycle is disallowed
2. For Read commands interrupting a Write burst, the DM pin must be used to mask the input data words which immediately precede the interrupting Read operation and the input data word which immediately follows the interrupting Read operation
3. For all cases of a Read interrupting a Write, the DQ and DQS buses must be released by the driving chip (i.e., the memory controller) in time to allow the buses to turn around before the DDR SDRAM drives them during a read operation.
4. If input Write data is masked by the Read command, the DQS input is ignored by the DDR SDRAM.
5. Refer to "3.3.2 Burst write operation"

## 3.3.8 Write Interrupted by a Precharge & DM

A burst write operation can be interrupted before completion of the burst by a precharge of the same bank. Random column access is allowed. A write recovery time ( $t_{WR}$ ) is required from the last data to precharge command. When precharge command is asserted, any residual data from the burst write cycle must be masked by DM.

**Figure 16. Write interrupted by a precharge and DM timing**

Precharge timing for Write operations in DRAMs requires enough time to allow "write recovery" which is the time required by a DRAM core to properly store a full '0' or '1' level before a Precharge operation. For DDR SDRAM, a timing parameter,  $t_{WR}$ , is used to indicate the required amount of time between the last valid write operation and a Precharge command to the same bank.

The precharge timing for writes is a complex definition since the write data is sampled by the data strobe and the address is sampled by the input clock. Inside the SDRAM, the data path is eventually synchronized with the address path by switching clock domains from the data strobe clock domain to the input clock domain. This makes the definition of when a precharge operation can be initiated after a write very complex since the write recovery parameter must reference only the clock domain that is used to time the internal write operation, i.e., the input clock domain.

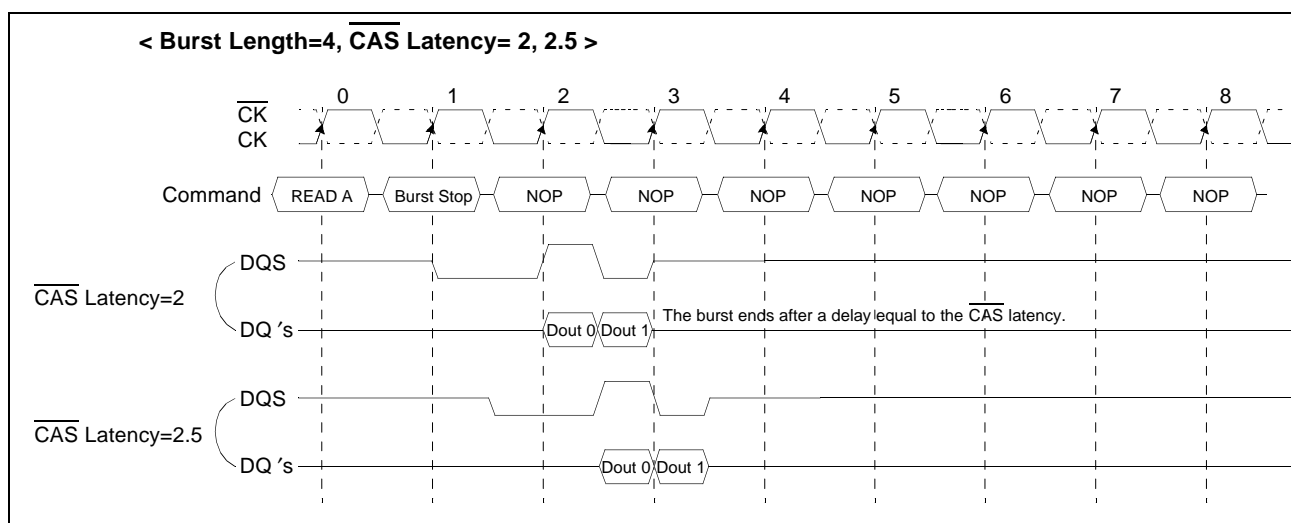

$t_{WR}$  starts on the rising clock edge after the last possible DQS edge that strobed in the last valid data and ends on the rising clock edge that strobes in the precharge command.

1. For the earliest possible Precharge command following a Write burst without interrupting the burst, the minimum time for write recovery is defined by  $t_{WR}$ .
2. When a precharge command interrupts a Write burst operation, the data mask pin, DM, is used to mask input data during the time between the last valid write data and the rising clock edge on which the Precharge command is given. During this time, the DQS input is still required to strobe in the state of DM. The minimum time for write recovery is defined by  $t_{WR}$ .

3. For a Write with autoprecharge command, a new Bank Activate command may be issued to the same bank after  $t_{WR}+t_{RP}$  where  $t_{WR}+t_{RP}$  starts on the falling DQS edge that strobed in the last valid data and ends on the rising clock edge that strobes in the Bank Activate command. During write with autoprecharge, the initiation of the internal precharge occurs at the same time as the earliest possible external Precharge command without interrupting the Write burst as described in 1 above.
4. In all cases, a Precharge operation cannot be initiated unless  $t_{RAS}(\min)$  [minimum Bank Activate to Precharge time] has been satisfied. This includes Write with autoprecharge commands where  $t_{RAS}(\min)$  must still be satisfied such that a Write with autoprecharge command has the same timing as a Write command followed by the earliest possible Precharge command which does not interrupt the burst.
5. Refer to "3.3.2 Burst write operation"

### 3.3.9 Burst Stop

The burst stop command is initiated by having  $\overline{RAS}$  and  $\overline{CAS}$  high with  $\overline{CS}$  and  $\overline{WE}$  low at the rising edge of the clock (CK). The burst stop command has the fewest restrictions making it the easiest method to use when terminating a burst read operation before it has been completed. When the burst stop command is issued during a burst read cycle, the pair of data and DQS (Data Strobe) go to a high impedance state after a delay which is equal to the CAS latency set in the mode register. The burst stop command, however, is not supported during a write burst operation.

**Figure 17. Burst stop timing**

The Burst Stop command is a mandatory feature for DDR SDRAMs. The following functionality is required:

1. The BST command may only be issued on the rising edge of the input clock, CK.
2. BST is only a valid command during Read bursts.
3. BST during a Write burst is undefined and shall not be used.
4. BST applies to all burst lengths.
5. BST is an undefined command during Read with autoprecharge and shall not be used.

6. When terminating a burst Read command, the BST command must be issued  $L_{BST}$  ("BST Latency") clock cycles before the clock edge at which the output buffers are tristated, where  $L_{BST}$  equals the CAS latency for read operations. This is shown in previous page Figure with examples for CAS latency (CL) of 1.5, 2, 2.5, 3 and 3.5 (only selected CAS latencies are required by the DDR SDRAM standards, the others are optional).
7. When the burst terminates, the DQ and DQS pins are tristated.

The BST command is not byte controllable and applies to all bits in the DQ data word and the(all) DQS pin(s).

### 3.3.10 DM masking

The DDR SDRAM has a data mask function that can be used in conjunction with data write cycle, not read cycle. When the data mask is activated (DM high) during write operation, DDR SDRAM does not accept the corresponding data. (DM to data-mask latency is zero).

DM must be issued at the rising or falling edge of data strobe.

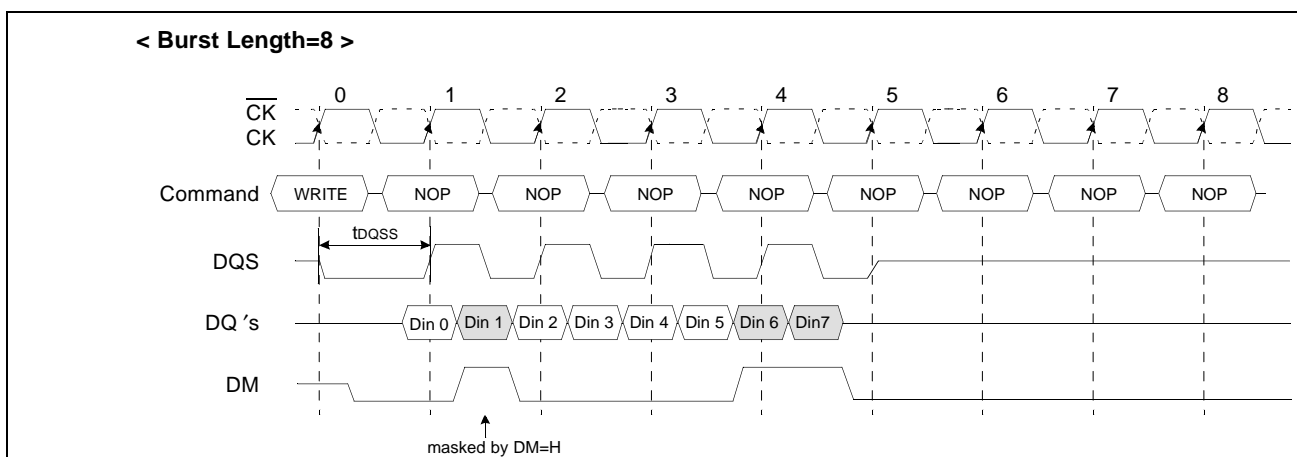

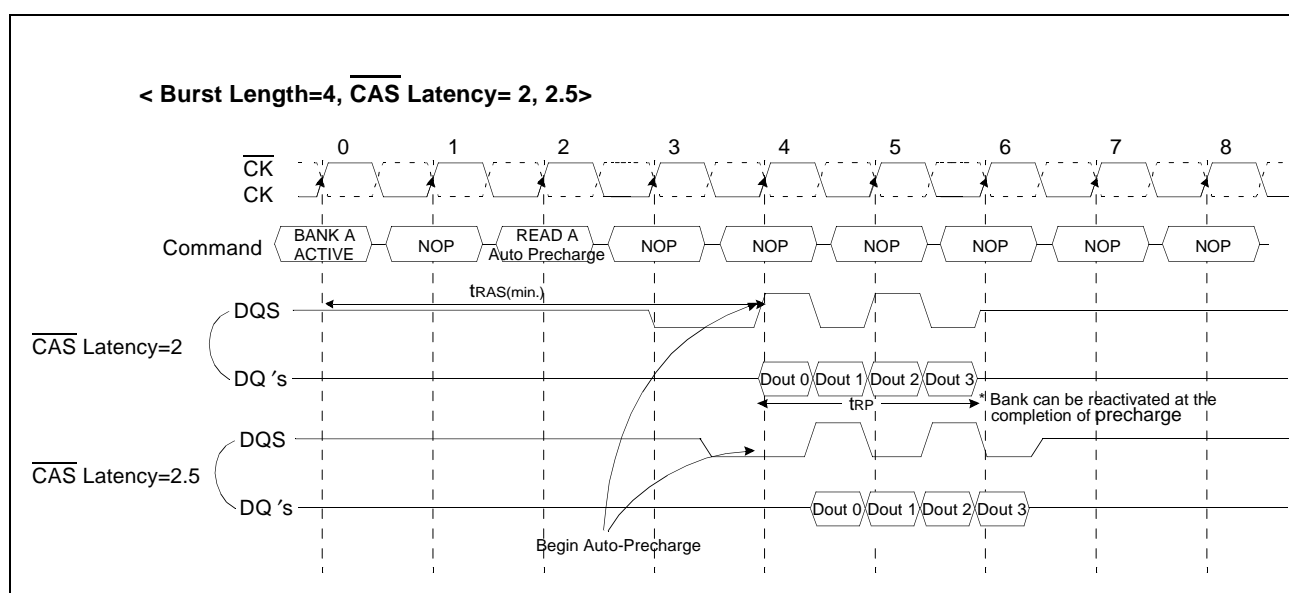

Figure 18. DM masking timing

## 3.3.11 Read With Auto Precharge

If a read with auto-precharge command is initiated, the DDR SDRAM automatically enters the precharge operation BL/2 clock later from a read with auto-precharge command when t<sub>TRAS</sub>(min) is satisfied. If not, the start point of precharge operation will be delayed until t<sub>TRAS</sub>(min) is satisfied. Once the precharge operation has started the bank cannot be reactivated and the new command can not be asserted until the precharge time(t<sub>RP</sub>) has been satisfied.

**Figure 19. Read with auto precharge timing**

When the Read with Auto precharge command is issued, new command can be asserted at 3,4 and 5 respectively as follows,

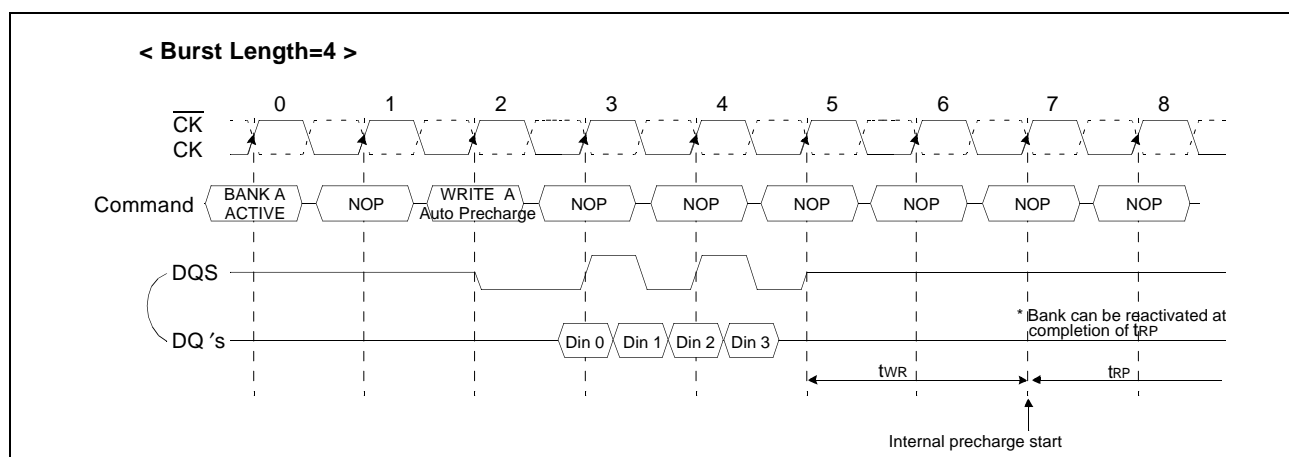

Asserted command	For same Bank			For Different Bank		
	3	4	5	3	4	5
READ	READ + No AP <sup>*1</sup>	READ+ No AP	Illegal	Legal	Legal	Legal
READ+AP	READ + AP	READ + AP	Illegal	Legal	Legal	Legal
Active	Illegal	Illegal	Illegal	Legal	Legal	Legal
Precharge	Legal	Legal	Illegal	Legal	Legal	Legal

<sup>\*1</sup>: AP = Auto Precharge

**Table 6. Operating description when new command asserted while read with auto precharge is issued**

## 3.3.12 Write with Auto Precharge

If A10 is high when write command is issued, the write with auto-precharge function is performed. Any new command to the same bank should not be issued until the internal precharge is completed. The internal precharge begins after keeping  $t_{WR}(\text{min})$ .

**Figure 20. Write with auto precharge timing**

Burst length = 4

Asserted command	For same Bank						For Different Bank				
	3	4	5	6	7	8	3	4	5	6	7
WRITE	WRITE+ No AP <sup>*1</sup>	WRITE+ No AP	WRITE+ No AP	Illegal	Illegal	Illegal	Legal	Legal	Legal	Legal	Legal

Active	Illegal	Illegal	Illegal	Illegal	Illegal	Illegal	Legal	Legal	Legal	Legal	Legal
Precharge	Illegal	Illegal	Illegal	Illegal	Illegal	Illegal	Legal	Legal	Legal	Legal	Legal

<sup>\*1</sup> : AP = Auto Precharge

<sup>\*2</sup> : DM : Refer to " 3.3.7 Write Interrupted by a Read & DM " in page 25.

**Table 7. Operating description when new command asserted while write with auto precharge is issued**

## 3.3.13 Auto Refresh & Self Refresh

### Auto Refresh

An auto refresh command is issued by having  $\overline{CS}$ ,  $\overline{RAS}$  and  $\overline{CAS}$  held low with CKE and  $\overline{WE}$  high at the rising edge of the clock(CK). All banks must be precharged and idle for  $t_{RP}(\text{min})$  before the auto refresh command is applied. No control of the external address pins is required once this cycle has started because of the internal address counter. When the refresh cycle has completed, all banks will be in the idle state. A delay between the auto refresh command and the next activate command or subsequent auto refresh command must be greater than or equal to the  $t_{RFC}(\text{min})$ .

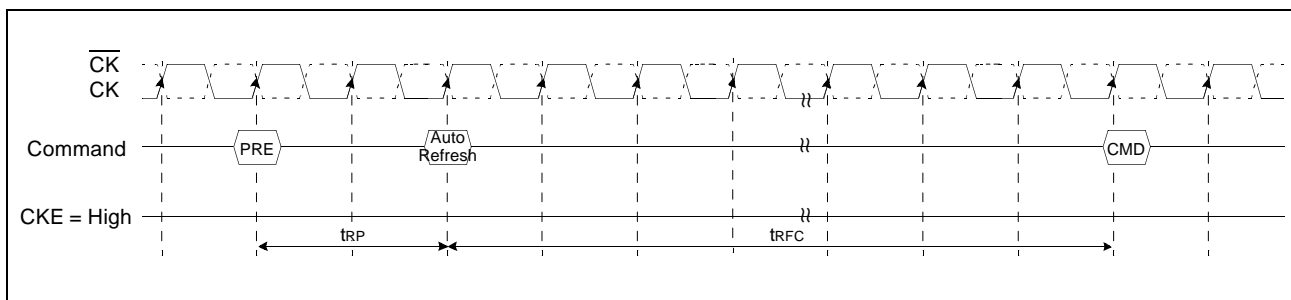

Figure 21. Auto refresh timing

### Self Refresh

A self refresh command is defined by having  $\overline{CS}$ ,  $\overline{RAS}$ ,  $\overline{CAS}$  and CKE held low with  $\overline{WE}$  high at the rising edge of the clock(CK). Once the self refresh command is initiated, CKE must be held low to keep the device in self refresh mode. During the self refresh operation, all inputs except CKE are ignored. The clock is internally disabled during self refresh operation to reduce power consumption. The self refresh is exited by supplying stable clock input before returning CKE high, asserting deselect or NOP command and then asserting CKE high for longer than  $t_{XSR}$  for locking of DLL.

Figure 22. Self refresh timing

1. Exit self refresh to bank active command, a write command can be applied as far as  $t_{RCD}$  is satisfied after any bank active command.
2. Exit self refresh to read command

## 3.3.14 Power down

The power down mode is entered when CKE is low and exited when CKE is high. Once the power down mode is initiated, all of the receiver circuits except clock, CKE and DLL circuit tree are gated off to reduce power consumption. All banks should be in idle state prior to entering the precharge power down mode and CKE should be set high at least  $1t_{CK}+t_{IS}$  prior to row active command. During power down mode, refresh operations cannot be performed, therefore the device cannot be remained in power down mode longer than the refresh period(Data retention time) of the device.

					L	H	H	H				9

(V=Valid, X=Don't Care, H=Logic High, L=Logic Low)

**Table 8. Command truth table**

- OP Code : Operand Code. A<sub>0</sub> ~ A<sub>11</sub> & BA<sub>0</sub> ~ BA<sub>1</sub> : Program keys. (@EMRS/MRS)
- EMRS/ MRS can be issued only at all banks precharge state.  
A new command can be issued 2 clock cycles after EMRS or MRS.
- Auto refresh functions are same as the CBR refresh of DRAM.  
The automatical precharge without row precharge command is meant by "Auto".  
Auto/self refresh can be issued only at all banks precharge state.
- BA<sub>0</sub> ~ BA<sub>1</sub> : Bank select addresses.  
If both BA<sub>0</sub> and BA<sub>1</sub> are "Low" at read, write, row active and precharge, bank A is selected.  
If both BA<sub>0</sub> is "High" and BA<sub>1</sub> is "Low" at read, write, row active and precharge, bank B is selected.  
If both BA<sub>0</sub> is "Low" and BA<sub>1</sub> is "High" at read, write, row active and precharge, bank C is selected.  
If both BA<sub>0</sub> and BA<sub>1</sub> are "High" at read, write, row active and precharge, bank D is selected.
- If A<sub>10</sub>/AP is "High" at row precharge, BA<sub>0</sub> and BA<sub>1</sub> are ignored and all banks are selected.
- During burst write with auto precharge, new read/write command can not be issued.  
Another bank read/write command can be issued after the end of burst.  
New row active of the associated bank can be issued at t<sub>RP</sub> after the end of burst.
- Burst stop command is valid at every burst length.
- DM sampled at the rising and falling edges of the DQS and Data-in are masked at the both edges (Write DM latency is 0).
- This combination is not defined for any function, which means "No Operation(NOP)" in DDR SDRAM.

## ABBREVIATIONS :

H=High Level, L=Low level, X=Don't Care

## Note :

1. All entries assume that CKE was High during the preceding clock cycle and the current clock cycle.
2. ILLEGAL to bank in specified state ; function may be legal in the bank indicated by BA, depending on the state of that bank.
3. Must satisfy bus contention, bus turn around and write recovery requirements.
4. NOP to bank precharging or in idle state. May precharge bank indicated by BA.
5. ILLEGAL if any bank is not idle.
6. Refer to "3.3.11 Read with Auto Precharge" in page 29 for detailed information.
7. Refer to "3.3.12 Write with Auto Precharge" in page 30 for detailed information.
8. CKE Low to High transition will re-enable CK,  $\overline{CK}$  and other inputs asynchronously. A minimum setup time must be satisfied before issuing any command other than EXIT.
9. Power-Down and Self-Refresh can be entered only from All Bank Idle state.

ILLEGAL = Device operation and/or data integrity are not guaranteed.

## 6. Absolute Maximum Rating

Parameter	Symbol	Value	Unit
Voltage on any pin relative to $V_{SS}$	$V_{IN}, V_{OUT}$	-0.5 ~ 3.6	V
Voltage on $V_{DD}$ supply relative to $V_{SS}$	$V_{DD}, V_{DDQ}$	-1.0 ~ 3.6	V
Voltage on $V_{DDQ}$ supply relative to $V_{SS}$	$V_{DDQ}$	-0.5 ~ 3.6	V
Storage temperature	$T_{STG}$	-55 ~ +150	°C
Power dissipation	$P_D$	1.0	W
Short circuit current	$I_{OS}$	50	mA

Note : Permanent device damage may occur if ABSOLUTE MAXIMUM RATINGS are exceeded.

Functional operation should be restricted to recommend operation condition.

Exposure to higher than recommended voltage for extended periods of time could affect device reliability

**Table 10. Absolute maximum ratings**

## 7. DC Operating Conditions & Specifications

### 7.1 DC Operating Conditions

Recommended operating conditions(Voltage referenced to  $V_{SS}=0V$ ,  $T_A=0$  to  $70^{\circ}C$ )

Parameter	Symbol	Min	Max	Unit	Note
Supply voltage(for device with a nominal $V_{DD}$ of 2.5V)	$V_{DD}$	2.3	2.7		
I/O Supply voltage	$V_{DDQ}$	2.3	2.7	V	
I/O Reference voltage	$V_{REF}$	$0.49 \cdot V_{DDQ}$	$0.51 \cdot V_{DDQ}$	V	1
I/O Termination voltage(system)	$V_{TT}$	$V_{REF}-0.04$	$V_{REF}+0.04$	V	2
Input logic high voltage	$V_{IH}(DC)$	$V_{REF}+0.15$	$V_{DDQ}+0.3$	V	
Input logic low voltage	$V_{IL}(DC)$	-0.3	$V_{REF}-0.15$	V	
Input Voltage Level, CK and $\overline{CK}$ inputs	$V_{IN}(DC)$	-0.3	$V_{DDQ}+0.3$	V	
Input Differential Voltage, CK and $\overline{CK}$ inputs	$V_{ID}(DC)$	0.3	$V_{DDQ}+0.6$	V	3
Input leakage current	$I_I$	-2	2	uA	
Output leakage current	$I_{OZ}$	-5	5	uA	
Output High Current ( $V_{OUT} = 1.95V$ )	$I_{OH}$	-16.8		mA	
Output Low Current ( $V_{OUT} = 0.55V$ )	$I_{OL}$	16.8		mA	

Notes 1.  $V_{REF}$  is expected to be equal to  $0.5 \cdot V_{DDQ}$  of the transmitting device, and to track variations in the DC level of the same. Peak-to-peak noise on  $V_{REF}$  may not exceed 2% of the DC value

2.  $V_{TT}$  is not applied directly to the device.  $V_{TT}$  is a system supply for signal termination resistors, is expected to be set equal to  $V_{REF}$ , and must track variations in the DC level of  $V_{REF}$

3.  $V_{ID}$  is the magnitude of the difference between the input level on CK and the input level on  $\overline{CK}$ .

**Table 11. DC operating condition**

## 7.2 DDR SDRAM SPEC Items and Test Conditions

Conditions	Symbol	Typ.	Worst
<b>Operating current - One bank Active-Precharge;</b> tRC=tRCmin;tCK=100Mhz for PC200, 133Mhz for PC266A & PC266B; DQ,DM and DQS inputs changing twice per clock cycle; address and control inputs changing once per clock cycle	IDD0	-	-
<b>Operating current - One bank operation ;</b> One bank open, BL=4, Reads - Refer to the following page for detailed test condition	IDD1	-	-
<b>Percharge power-down standby current;</b> All banks idle; power - down mode; CKE = <V <sub>IL</sub> (max); tCK=100Mhz for PC200, 133Mhz for PC266A & PC266B; Vin = Vref for DQ,DQS and DM	IDD2P	-	-
<b>Precharge Floating standby current;</b> CS# > =V <sub>IH</sub> (min);All banks idle; CKE > = V <sub>IH</sub> (min); tCK=100Mhz for PC200, 133Mhz for PC266A & PC266B; Address and other control inputs changing once per clock cycle; Vin = Vref for DQ,DQS and DM	IDD2F	-	-
<b>Precharge Quiet standby current;</b> CS# > = V <sub>IH</sub> (min); All banks idle; CKE > = V <sub>IH</sub> (min); tCK = 100Mhz for PC200, 133Mhz for PC266A & PC266B; Address and other control inputs stable with keeping >= V <sub>IH</sub> (min) or <=V <sub>IL</sub> (max); Vin = Vref for DQ ,DQS and DM	IDD2Q	-	-
<b>Active power - down standby current ;</b> one bank active; power-down mode; CKE=< V <sub>IL</sub> (max); tCK = 100Mhz for PC200, 133Mhz for PC266A & PC266B; Vin = Vref for DQ,DQS and DM	IDD3P	-	-
<b>Active standby current;</b> CS# >= V <sub>IH</sub> (min); CKE>=V <sub>IH</sub> (min); one bank active; active - precharge; tRC=tRASmax; tCK = 100Mhz for PC200, 133Mhz for PC266A & PC266B; DQ, DQS and DM inputs changing twice per clock cycle; address and other control inputs changing once per clock cycle	IDD3N	-	-
<b>Operating current - burst read;</b> Burst length = 2; reads; contiguous burst; One bank active; address and control inputs changing once per clock cycle; CL=2 at tCK = 100Mhz for PC200, CL=2 at tCK = 133Mhz for PC266A, CL=2.5 at tCK = 133Mhz for PC266B ; 50% of data changing at every burst; Iout = 0 m A	IDD4R	-	-
<b>Operating current - burst write;</b> Burst length = 2; writes; contiguous burst; One bank active address and control inputs changing once per clock cycle; CL=2 at tCK = 100Mhz for PC200, CL=2 at tCK = 133Mhz for PC266A, CL=2.5 at tCK = 133Mhz for PC266B ; DQ, DM and DQS inputs changing twice per clock cycle, 50% of input data changing at every burst	IDD4W	-	-
<b>Auto refresh current;</b> tRC = tRFC(min) - 8*tCK for PC200 at 100Mhz, 10*tCK for PC266A & PC266B at 133Mhz; distributed refresh	IDD5	-	-
<b>Self refresh current;</b> CKE =< 0.2V; External clock should be on; tCK = 100Mhz for PC200, 133Mhz for PC266A & PC266B	IDD6	-	-
<b>Operating current - Four bank operation ;</b> Four bank interleaving with BL=4 -Refer to the following page for detailed test condition	IDD7	-	-

Typical case: VDD = 2.5V, T = 25C

Worst case : VDD = 2.7V, T = 10C

Table 12. 128Mb DDR SDRAM IDD SPEC Table

## < Detailed test conditions for DDR SDRAM IDD1 & IDD7 >

### IDD1 : Operating current: One bank operation

1. Typical Case : Vdd = 2.5V, T=25°C
2. Worst Case : Vdd = 2.7V, T= 10°C
3. Only one bank is accessed with tRC(min), Burst Mode, Address and Control inputs on NOP edge are changing once per clock cycle. Iout = 0mA
4. Timing patterns
  - PC200(100Mhz, CL=2) : tCK = 10ns, CL2, BL=4, tRCD = 2\*tCK, tRAS = 5\*tCK  
Read : A0 N R0 N N P0 N A0 N - repeat the same timing with random address changing  
\*50% of data changing at every burst
  - PC266B(133Mhz, CL=2.5) : tCK = 7.5ns, CL=2.5, BL=4, tRCD = 3\*tCK, tRC = 9\*tCK, tRAS = 5\*tCK  
Read : A0 N N R0 N P0 N N A0 N - repeat the same timing with random address changing  
\*50% of data changing at every burst
  - PC266A (133Mhz, CL=2) : tCK = 7.5ns, CL=2, BL=4, tRCD = 3\*tCK, tRC = 9\*tCK, tRAS = 5\*tCK  
Read : A0 N N R0 N P0 N N A0 N - repeat the same timing with random address changing  
\*50% of data changing at every burst

Legend : A=Activate, R=Read, W=Write, P=Precharge, N=NOP

## IDD7 : Operating current: Four bank operation

1. Typical Case : Vdd = 2.5V, T=25°C
2. Worst Case : Vdd = 2.7V, T= 10°C
3. Four banks are being interleaved with tRC(min), Burst Mode, Address and Control inputs on NOP edge are not changing. Iout = 0mA
4. Timing patterns
  - PC200(100Mhz, CL=2) : tCK = 10ns, CL2, BL=4, tRRD = 2\*tCK, tRCD= 3\*tCK, Read with autoprecharge  
Read : A0 N A1 R0 A2 R1 A3 R2 A0 R3 A1 R0 - repeat the same timing with random address changing  
\*50% of data changing at every burst
  - PC266B(133Mhz, CL=2.5) : tCK = 7.5ns, CL=2.5, BL=4, tRRD = 2\*tCK, tRCD = 3\*tCK  
Read with autoprecharge  
Read : A0 N A1 R0 A2 R1 A3 R2 N R3 A0 N A1 R0 - repeat the same timing with random address changing  
\*50% of data changing at every burst
  - PC266A (133Mhz, CL=2) : tCK = 7.5ns, CL=2, BL=4, tRRD = 2\*tCK, tRCD = 3\*tCK  
Read : A0 N A1 R0 A2 R1 A3 R2 N R3 A0 N A1 R0 - repeat the same timing with random address changing  
\*50% of data changing at every burst

Legend : A=Activate, R=Read, W=Write, P=Precharge, N=NOP

## 8. AC Operating Conditions & Timming Specification

### 8.1 AC Operating Conditions

Parameter/Condition	Symbol	Min	Max	Unit	Note
Input High (Logic 1) Voltage, DQ, DQS and DM signals	VIH(AC)	VREF + 0.31		V	1
Input Low (Logic 0) Voltage, DQ, DQS and DM signals.	VIL(AC)		VREF - 0.31	V	2
Input Differential Voltage, CK and CK inputs	VID(AC)	0.62	VDDQ+0.6	V	3
Input Crossing Point Voltage, CK and CK inputs	VIX(AC)	0.5*VDDQ-0.2	0.5*VDDQ+0.2	V	4

Note 1. Vih(max) = 4.2V. The overshoot voltage duration is ≤ 3ns at VDD.

2. Vil(min) = -1.5V. The undershoot voltage duration is ≤ 3ns at VSS.

3. VID is the magnitude of the difference between the input level on CK and the input on  $\overline{CK}$ .

4. The value of VIX is expected to equal 0.5\*VDDQ of the transmitting device and must track variations in the DC level of the same.

**Table 13. AC operating conditions**

## 8.2 AC Timing Parameters &amp; Specifications

Parameter	Symbol	- A2(PC266@CL=2)		- B0(PC266@CL=2.5)		- A0(PC200@CL=2)		Unit	Note

Parameter	Symbol	-A2(PC266@CL=2)		-B0(PC266@CL=2.5)		-A0(PC200@CL=2)		Unit	Note
		Min	Max	Min	Max	Min	Max		
Exit self refresh to bank active command	tXSA	75		75		80		ns	7
Exit self refresh to read command	tXSR	200		200		200		Cycle	
Refresh interval time	64Mb, 128Mb 256Mb	tREF	15.6		15.6		15.6	us	1
			7.8		7.8		7.8	us	1
Output DQS valid window	tQH	tHPmin -0.75ns	-	tHPmin -0.75ns	-	tHPmin -1.0ns	-	ns	
Clock half period	tHP	tCLmin or tCHmin	-	tCLmin or tCHmin	-	tCLmin or tCHmin	-	ns	
DQS write postamble time	tWPST	0.25		0.25		0.25		tCK	4
QFC setup to first DQS edge on reads	tQCS	0.9	1.1	0.9	1.1	0.9	1.1	tCK	
QFC hold after last DQS edge on reads	tQCH	0.4	0.6	0.4	0.6	0.4	0.6	tCK	
Write command to QFC delay on write	tQCSW		4.0		4.0		4.0	ns	
Write burst end to QFC delay on write	tQCHW	1.25ns	0.5tCK	1.25ns	0.5tCK	1.25ns	0.5tCK		5
Write burst end to QFC delay on write interrupted by Precharge	tQCHWI	-	1.5tCK	-	1.5tCK	-	1.5tCK		6

1. Maximum burst refresh of 8
2. tHZQ transitions occurs in the same access time windows as valid data transitions. These parameters are not referenced to a specific voltage level, but specify when the device output is no longer driving.
3. The specific requirement is that DQS be valid(High or Low) on or before this CK edge. The case shown(DQS going from High\_Z to logic Low) applies when no writes were previously in progress on the bus. If a previous write was in progress, DQS could be High at this time, depending on tDQSS.
4. The maximum limit for this parameter is not a device limit. The device will operate with a great value for this parameter, but system performance (bus turnaround) will degrade accordingly.
5. The value of tQCSW min. is 1.25ns from the last low going data strobe edge to  $\overline{QFC}$  high. And the value of tQCSW max. is 0.5tCK from the first high going clock edge after the last low going data strobe edge to  $\overline{QFC}$  high.
6. the value of tQCSWI max. is 1.5tCK from the first high going clock edge after the last low going data strobe edge to  $\overline{QFC}$  high.
7. A write command can be applied with tRCD satisfied after this command.

**Table 14. AC timing parameters and specifications**

## 9. AC Operating Test Conditions

(VDD=2.5V, VDDQ=2.5V, TA= 0 to 70°C)

Parameter	Value	Unit	Note
Input reference voltage for Clock	$0.5 * V_{DDQ}$	V	
Input signal maximum peak swing	1.5	V	
Input signal minimum slew rate	1.0	V/ns	
Input Levels(VIH/VIL)	$V_{REF}+0.31/V_{REF}-0.31$	V	
Input timing measurement reference level	$V_{REF}$	V	
Output timing measurement reference level	$V_{tt}$	V	
Output load condition	See Load Circuit		

**Table 15. AC operating test conditions**

**Figure 24. Output Load Circuit (SSTL\_2)**

## 10. Input/Output Capacitance

(VDD=2.5, VDDQ=2.5V, TA= 25°C, f=1MHz)

Parameter	Symbol	Min	Max	Delta Cap(max)	Unit
Input capacitance (A0 ~ A11, BA0 ~ BA1, CKE, $\overline{CS}$ , $\overline{RAS}$ , $\overline{CAS}$ , $\overline{WE}$ )	CIN1	2	3.0	0.5	pF
Input capacitance( CK, $\overline{CK}$ )	CIN2	2	3.0	0.25	pF
Data & DQS input/output capacitance	COUT	4.0	5.0	0.5	pF
Input capacitance(DM)	CIN3	4.0	5.0		pF

**Table 16. Input/output capacitance**

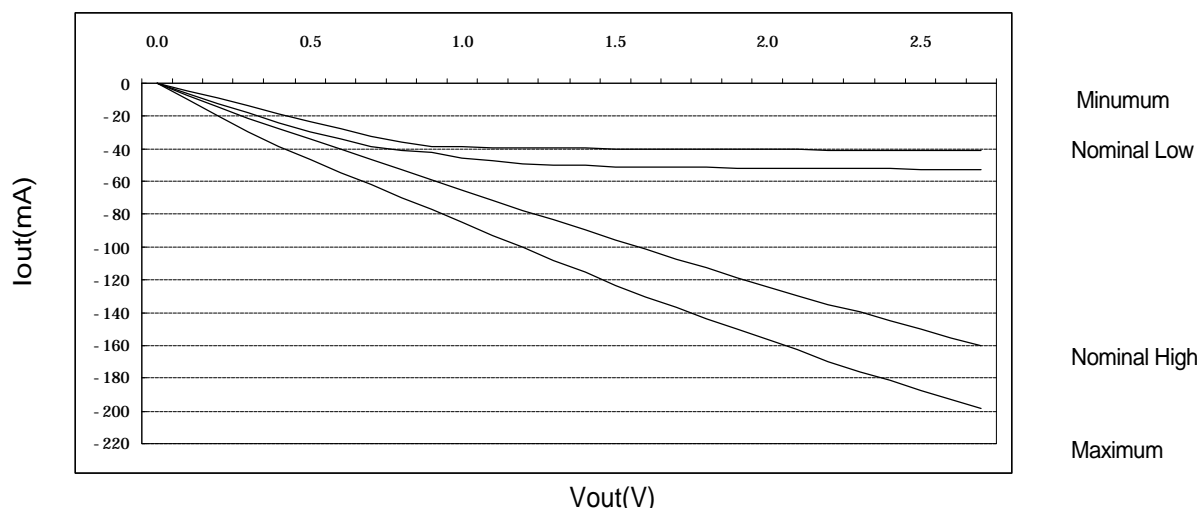

## 11. IBIS: I/V Characteristics for Input and Output Buffers

### 11.1 Normal strength driver

1. The nominal pulldown V-I curve for DDR SDRAM devices will be within the inner bounding lines of the V-I curve of Figure a.
2. The full variation in driver pulldown current from minimum to maximum process, temperature and voltage will lie within the outer bounding lines the of the V-I curve of below Figure.

3. The nominal pullup V-I curve for DDR SDRAM devices will be within the inner bounding lines of the V-I curve of below Figure.
4. The Full variation in driver pullup current from minimum to maximum process, temperature and voltage will lie within the outer bounding lines of the V-I curve of below Figure

5. The full variation in the ratio of the maximum to minimum pullup and pulldown current will not exceed 1.7, for device drain to source voltage from 0 to  $V_{DDQ}/2$
6. The Full variation in the ratio of the nominal pullup to pulldown current should be unity  $\pm 10\%$ , for device drain to source voltages from 0 to  $V_{DDQ}/2$

Figure 25. I/V characteristics for input/output buffers: Pull up(above) and pull down(below)

Voltage (V)	Pulldown Current (mA)				pullup Current (mA)			
	Nominal Low	Nominal High	Minimum	Maximum	Nominal Low	Nominal High	Minimum	Maximum
0.1	6.0	6.8	4.6	9.6	-6.1	-7.6	-4.6	-10.0
0.2	12.2	13.5	9.2	18.2	-12.2	-14.5	-9.2	-20.0

1.5	60.1	82.3	47.7	103.8	-50.7	-95.5	-39.9	-123.0
1.6	60.5	85.9	48.0	108.4	-51.0	-101.3	-40.1	-130.4
1.7	61.0	89.1	48.4	112.1	-51.1	-107.1	-40.2	-136.7
1.8	61.5	92.2	48.9	115.9	-51.3	-112.4	-40.3	-144.2
1.9	62.0	95.3	49.1	119.6	-51.5	-118.7	-40.4	-150.5
2.0	62.5	97.2	49.4	123.3	-51.6	-124.0	-40.5	-156.9
2.1	62.9	99.1	49.6	126.5	-51.8	-129.3	-40.6	-163.2
2.2	63.3	100.9	49.8	129.5	-52.0	-134.6	-40.7	-169.6
2.3	63.8	101.9	49.9	132.4	-52.2	-139.9	-40.8	-176.0
2.4	64.1	102.8	50.0	135.0	-52.3	-145.2	-40.9	-181.3
2.5	64.6	103.8	50.2	137.3	-52.5	-150.5	-41.0	-187.6
2.6	64.8	104.6	50.4	139.2	-52.7	-155.3	-41.1	-192.9
2.7	65.0	105.4	50.5	140.8	-52.8	-160.1	-41.2	-198.2

**Table 17. Pull down and pull up current values**

Temperature (T<sub>junction</sub>)

Typical      50°C  
Minimum      0°C  
Maximum     100°C

V<sub>dd</sub>/V<sub>ddq</sub>

Normal        2.5V  
Minimum      2.3V  
Maximum      2.7V

The above characteristics are specied under best, worst and normal process variation/conditions

## 11.2 Half Strength Driver

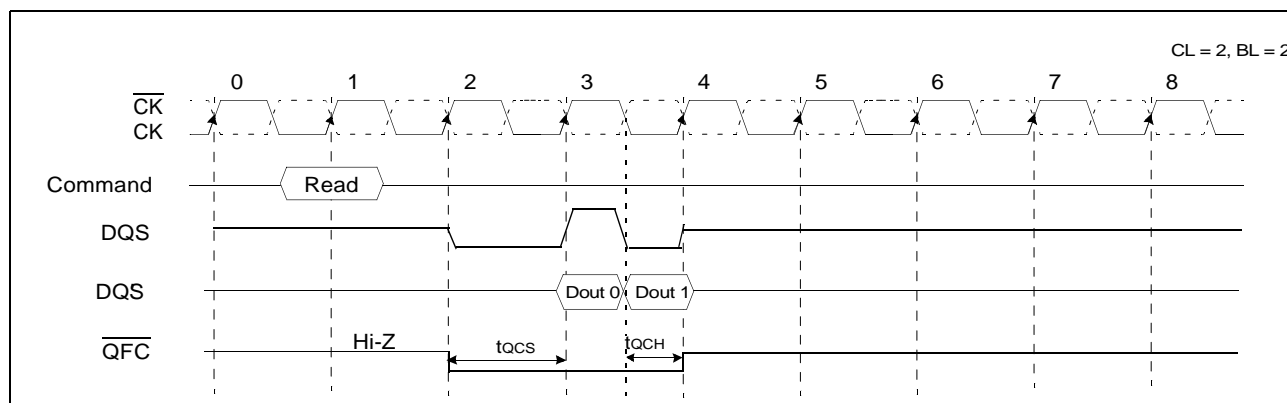

*The half strength driver IBIS will be included in the future.*

12.  $\overline{\text{QFC}}$  function $\overline{\text{QFC}}$  definition

when drive low on reads coincident with the start of DQS, this DRAM output signal says that one cycle later there will be the first valid DQS output and returned to HI-Z after this finishing a burst operation. It is also driven low shortly after a write command is received and returned to HI-Z shortly after the last data strobe transition is received. Whenever the device is in standby, the signal is HI-Z.  $\overline{\text{QFC}}$  is intended to enable an external data switch.  $\overline{\text{QFC}}$  can be enabled or disabled through EMRS control.

 $\overline{\text{QFC}}$  timing on Read operation

$\overline{\text{QFC}}$  on reads is enabled coincident with the start of DQS preamble, and disabled coincident with the end of DQS postamble

Figure 26.  $\overline{\text{QFC}}$  timing on read operation

## QFC timing on Write operation

$\overline{\text{QFC}}$  on writes is enabled as soon as possible after the clock edge of write command and disabled as soon as possible after the last DQS-in low going edge.

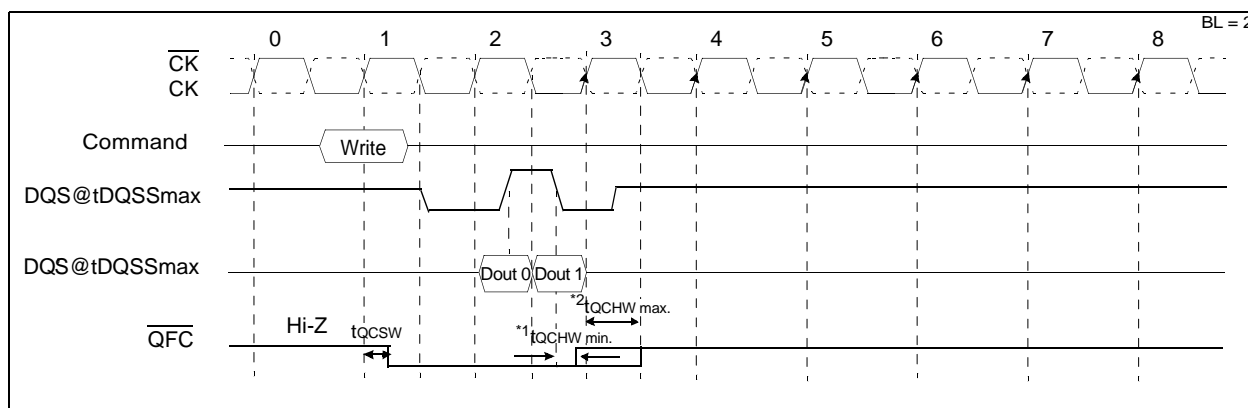

Figure 27. : QFC timing on write operation with tDQSSmax

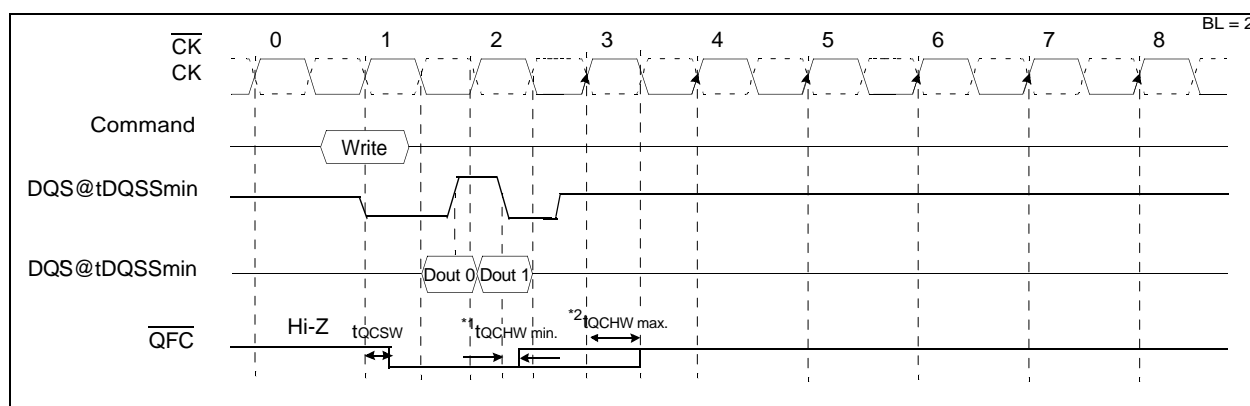

Figure 28. : QFC timing on write operation with tDQSSmin

1. The value of tQCSW min. is 1.25ns from the last low going data strobe edge to  $\overline{\text{QFC}}$  tri-state.
2. The value of tQCSW max. is 0.5tcK from the first high going clock edge after the last low going data strobe edge to  $\overline{\text{QFC}}$  tri-state.

## QFC timing example for interrupted Writes operation
