GENERAL DESCRIPTION

The Samsung KMM53240(1)04CK is a 4Mx32bits Dynamic RAM high density memory module. The Samsung KMM53240(1)04CK consists of eight CMOS 4Mx4bits DRAMs in 24-pin SOJ package mounted on a 72-pin glass-epoxy sub-strate. NOTES

1. An initial pause of 200us is required after power-up followed by any 8 $\overline{RAS}$-only or $\overline{CAS}$-before-$\overline{RAS}$ refresh cycles before proper device operation is achieved.

2. V_{IH}(min) and V_{IL}(max) are reference levels for measuring timing of input signals. Transition times are measured between V_{IH}(min) and V_{IL}(max) and are assumed to be 5ns for all inputs.

3. Measured with a load equivalent to 2 TTL loads and 100pF.

4. Operation within the t_{RCD}(max) limit insures that t_{RAC}(max) can be met. t_{RCD}(max) is specified as a reference point only. If t_{RCD} is greater than the specified t_{RCD}(max) limit, then access time is controlled exclusively by t_{CAC}.

5. Assumes that $t_{RCD} \geq t_{RCD}$(max).

6. This parameter defines the time at which the output achieves the open circuit condition and is not referenced to V_{OH} or V_{OL}.

7. t_{WCS} is non-restrictive operating parameter. It is included in the data sheet as electrical characteristics only. If $t_{WCS} \geq t_{WCS}$(min), the cycle is an early write cycle and the data out pin will remain high impedance for the duration of the cycle.

8. Either t_{RCH} or t_{RRH} must be satisfied for a read cycle.

9. These parameter are referenced to the $\overline{CAS}$ leading edge in early write cycles and to the $\overline{W}$ leading edge in read-write cycles.

10. Operation within the t_{RAD}(max) limit insures that t_{RAC}(max) can be met. t_{RAD}(max) is specified as reference point only. If t_{RAD} is greater than the specified t_{RAD}(max) limit, then access time is controlled by t_{AA}.

11. t_{CEZ}(max), t_{REZ}(max), t_{WEZ}(max) and t_{OEZ}(max) define the time at which the output achieves the open circuit condition and are not referenced to output voltage level.

12. If $\overline{RAS}$ goes to high before $\overline{CAS}$ high going, the open circuit condtion of the output is achieved by $\overline{CAS}$ high going. If $\overline{CAS}$ goes to high before $\overline{RAS}$ high going, the open circuit condtion of the output is achieved by $\overline{RAS}$ high going.

13. $t_{ASC} \geq t_{CP}$ min
