GENERAL DESCRIPTION

The K6R4016V1C is a 4,194,304-bit high-speed Static Random Access Memory organized as 262,144 words by 16 bits. The K6R4016V1C uses 16 common input and output lines and has an output enable pin which operates faster than address access time at read cycle. Also it allows that lower and upper byte access by data byte control(UB, LB). The device is fabricated using SAMSUNG's advanced CMOS process and designed for high-speed circuit technology. It is particularly well suited for use in high-density high-speed system applications. The K6R4016V1C is packaged in a 400mil 44-pin plastic SOJ or TSOP(II) forward or 48 Fine pitch BGA.

TIMMING DIAGRAMS

TIMING WAVEFORM OF READ CYCLE(1) (Address Controlled, $\overline{CS}=\overline{OE}=V_{IL}$, $\overline{WE}=V_{IH}$, $\overline{UB}$, $\overline{LB}=V_{IL}$)TIMING WAVEFORM OF READ CYCLE(2) ($\overline{WE}=V_{IH}$)

NOTES(READ CYCLE)

1. $\overline{WE}$ is high for read cycle.
2. All read cycle timing is referenced from the last valid address to the first transition address.
3. t_{HZ} and t_{OHZ} are defined as the time at which the outputs achieve the open circuit condition and are not referenced to V_{OH} or V_{OL} levels.
4. At any given temperature and voltage condition, $t_{HZ}(\text{Max.})$ is less than $t_{LZ}(\text{Min.})$ both for a given device and from device to device.
5. Transition is measured $\pm 200\text{mV}$ from steady state voltage with Load(B). This parameter is sampled and not 100% tested.
6. Device is continuously selected with $\overline{CS} = V_{IL}$.
7. Address valid prior to coincident with $\overline{CS}$ transition low.
8. For common I/O applications, minimization or elimination of bus contention conditions is necessary during read and write cycle.

TIMING WAVEFORM OF WRITE CYCLE(1) ($\overline{OE}$ Clock)**TIMING WAVEFORM OF WRITE CYCLE(2) ($\overline{OE}$ =Low fixed)**

TIMING WAVEFORM OF WRITE CYCLE(3) ($\overline{\text{CS}}$ =Controlled)TIMING WAVEFORM OF WRITE CYCLE(4) ($\overline{\text{UB}}$, $\overline{\text{LB}}$ Controlled)

NOTES(WRITE CYCLE)

1. All write cycle timing is referenced from the last valid address to the first transition address.
2. A write occurs during the overlap of a low $\overline{\text{CS}}$, $\overline{\text{WE}}$, $\overline{\text{LB}}$ and $\overline{\text{UB}}$. A write begins at the latest transition $\overline{\text{CS}}$ going low and $\overline{\text{WE}}$ going low; A write ends at the earliest transition $\overline{\text{CS}}$ going high or $\overline{\text{WE}}$ going high. t_{WP} is measured from the beginning of write to the end of write.
3. t_{CW} is measured from the later of $\overline{\text{CS}}$ going low to end of write.
4. t_{AS} is measured from the address valid to the beginning of write.
5. t_{WR} is measured from the end of write to the address change. t_{WR} applied in case a write ends as $\overline{\text{CS}}$ or $\overline{\text{WE}}$ going high.
6. If $\overline{\text{OE}}$, $\overline{\text{CS}}$ and $\overline{\text{WE}}$ are in the Read Mode during this period, the I/O pins are in the output low-Z state. Inputs of opposite phase of the output must not be applied because bus contention can occur.
7. For common I/O applications, minimization or elimination of bus contention conditions is necessary during read and write cycle.
8. If $\overline{\text{CS}}$ goes low simultaneously with $\overline{\text{WE}}$ going or after $\overline{\text{WE}}$ going low, the outputs remain high impedance state.
9. D_{out} is the read data of the new address.
10. When $\overline{\text{CS}}$ is low: I/O pins are in the output state. The input signals in the opposite phase leading to the output should not be applied.
