The attached data sheets are prepared and approved by SAMSUNG Electronics. SAMSUNG Electronics CO., LTD. reserve the right to change the specifications. SAMSUNG Electronics will evaluate and reply to your requests and questions on the parameters of this device. If you have any questions, please contact the SAMSUNG branch office near your office, call or contact Headquarters.

ELECTRONICS

128Kx36 & 256Kx18-Bit Synchronous Pipelined Burst SRAM

FEATURES

- Synchronous Operation.
- 2 Stage Pipelined operation with 4 Burst.
- On-Chip Address Counter.
- Self-Timed Write Cycle.
- On-Chip Address and Control Registers.
- $V_{DD} = 3.3V + 0.3V - 0.165V$ Power Supply.
- V_{DDA} Supply Voltage $3.3V + 0.3V - 0.165V$ for $3.3V$ I/O or $2.5V + 0.4V - 0.125V$ for $2.5V$ I/O.
- 5V Tolerant Inputs Except I/O Pins.
- Byte Writable Function.
- Global Write Enable Controls a full bus-width write.
- Power Down State via ZZ Signal.
- LBO Pin allows a choice of either a interleaved burst or a linear burst.
- Three Chip Enables for simple depth expansion with No Data Contention ; 2cycle Enable, 1cycle Disable.
- Asynchronous Output Enable Control.
- ADSP, ADSC, ADV Burst Control Pins.
- TTL-Level Three-State Output.
- 100-TQFP-1420A .

FAST ACCESS TIMES

| PARAMETER | Symbol | -30 | -27 | -25 | -22 | -20 | -18 | Unit |

| Clock Access Time | tCD | 2.2 | 2.2 | 2.4 | 2.6 | 2.8 | 3.0 | ns |
| Output Enable Access Time | tOE | 2.2 | 2.2 | 2.4 | 2.6 | 2.8 | 3.0 | ns |

GENERAL DESCRIPTION

The K7A403609A and K7A401809A are 4,718,592-bit Synchronous Static Random Access Memory designed for high performance second level cache of Pentium and Power PC based System.

It is organized as 128K(256K) words of 36(18) bits and integrates address and control registers, a 2-bit burst address counter and added some new functions for high performance cache RAM applications; GW, BW, LBO, ZZ. Write cycles are internally self-timed and synchronous.

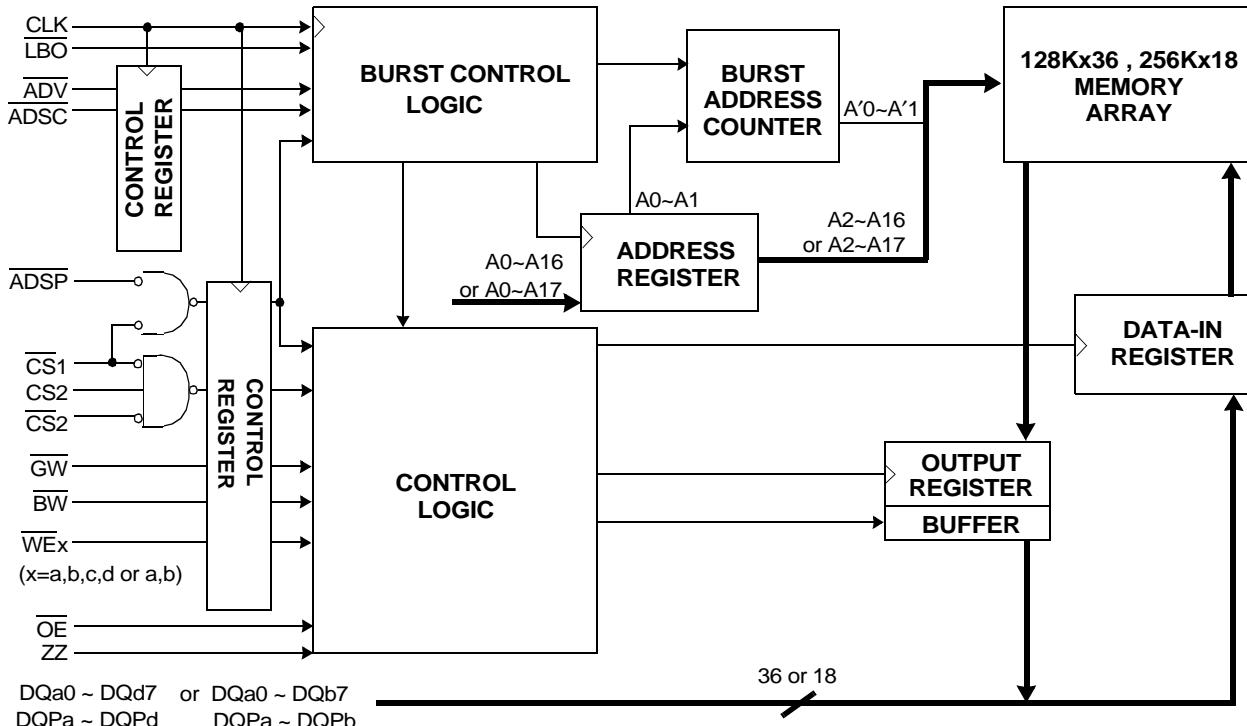

Full bus-width write is done by GW, and each byte write is performed by the combination of WEx and BW when GW is high. And with CS1 high, ADSP is blocked to control signals. Burst cycle can be initiated with either the address status processor(ADSP) or address status cache controller(ADSC) inputs. Subsequent burst addresses are generated internally in the system's burst sequence and are controlled by the burst address advance(ADV) input.

LBO pin is DC operated and determines burst sequence(linear or interleaved).

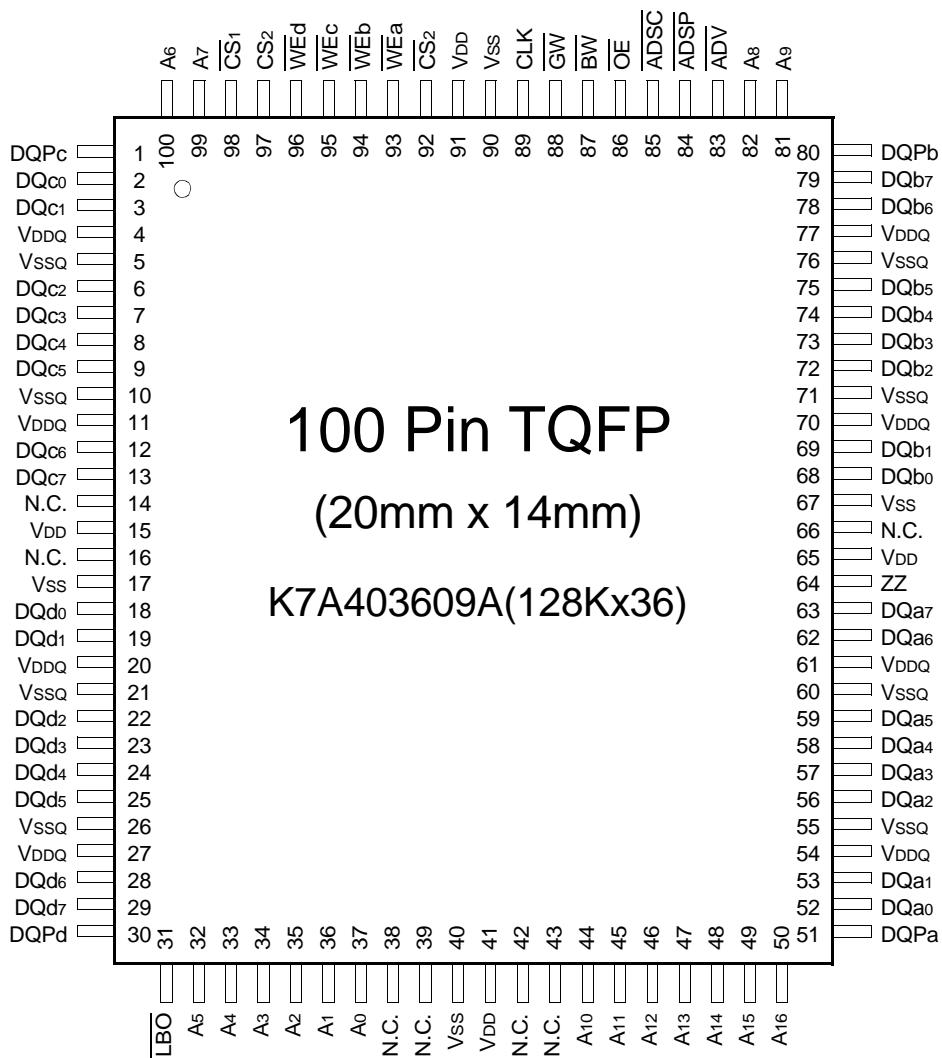

ZZ pin controls Power Down State and reduces Stand-by current regardless of CLK.

The K7A403609A and K7A401809A are fabricated using SAMSUNG's high performance CMOS technology and is available in a 100pin TQFP package. Multiple power and ground pins are utilized to minimize ground bounce.

K7A403609A**K7A401809A****128Kx36 & 256Kx18 Synchronous SRAM****FUNCTION DESCRIPTION**

The K7A403609A and K7A401809A are synchronous SRAM designed to support the burst address accessing sequence of the P6 and Power PC based microprocessor. All inputs (with the exception of OE, LBO and ZZ) are sampled on rising clock edges. The start and duration of the burst access is controlled by ADSC, ADSP and ADV and chip select pins.

The accesses are enabled with the chip select signals and output enabled signals. Wait states are inserted into the access with ADV.

When ZZ is pulled high, the SRAM will enter a Power Down State. At this time, internal state of the SRAM is preserved. When ZZ returns to low, the SRAM normally operates after 2cycles of wake up time. ZZ pin is pulled down internally.

Read cycles are initiated with ADSP (regardless of WEx and ADSC) using the new external address clocked into the on-chip address register whenever ADSP is sampled low, the chip selects are sampled active, and the output buffer is enabled with OE. In read operation the data of cell array accessed by the current address, registered in the Data-out registers by the positive edge of CLK, are carried to the Data-out buffer by the next positive edge of CLK. The data, registered in the Data-out buffer, are projected to the output pins. ADV is ignored on the clock edge that samples ADSP asserted, but is sampled on the subsequent clock edges. The address increases internally for the next access of the burst when WEx are sampled High and ADV is sampled low. And ADSP is blocked to control signals by disabling CS1.

All byte write is done by GW (regardless of BW and WEx), and each byte write is performed by the combination of BW and WEx when GW is high.

Write cycles are performed by disabling the output buffers with OE and asserting WEx. WEx are ignored on the clock edge that samples ADSP low, but are sampled on the subsequent clock edges. The output buffers are disabled when WEx are sampled Low (regardless of OE). Data is clocked into the data input register when WEx sampled Low. The address increases internally to the next address of burst, if both WEx and ADV are sampled Low. Individual byte write cycles are performed by any one or more byte write enable signals (WEa, WEb, WEc or WEd) sampled low. The WEa controls DQa0 ~ DQa7 and DQPa, WEb controls DQb0 ~ DQb7 and DQPb, WEc controls DQc0 ~ DQc7 and DQPc, and WEd controls DQd0 ~ DQd7 and DQPd. Read or write cycle may also be initiated with ADSC, instead of ADSP. The differences between cycles initiated with ADSC and ADSP are as follows;

ADSP must be sampled high when ADSC is sampled low to initiate a cycle with ADSC.

WEx are sampled on the same clock edge that sampled ADSC low (and ADSP high).

Addresses are generated for the burst access as shown below. The starting point of the burst sequence is provided by the external address. The burst address counter wraps around to its initial state upon completion. The burst sequence is determined by the state of the LBO pin. When this pin is Low, linear burst sequence is selected. When this pin is High, Interleaved burst sequence is selected.

BURST SEQUENCE TABLE

(Interleaved Burst)

| LBO PIN | HIGH | Case 1 | | Case 2 | | Case 3 | | Case 4 | |
|----------------|------|--------|----|--------|----|--------|----|--------|----|
| | | A1 | A0 | A1 | A0 | A1 | A0 | A1 | A0 |
| First Address | | 0 | 0 | 0 | 1 | 1 | 0 | 1 | 1 |
| | | 0 | 1 | 0 | 0 | 1 | 1 | 1 | 0 |
| | | 1 | 0 | 1 | 1 | 0 | 0 | 0 | 1 |
| Fourth Address | | 1 | 1 | 1 | 0 | 0 | 1 | 0 | 0 |
| | | | | | | | | | |

Note : 1. LBO pin must be tied to High or Low, and Floating State must not be allowed.

(Linear Burst)

| LBO PIN | LOW | Case 1 | | Case 2 | | Case 3 | | Case 4 | |
|----------------|-----|--------|----|--------|----|--------|----|--------|----|
| | | A1 | A0 | A1 | A0 | A1 | A0 | A1 | A0 |
| First Address | | 0 | 0 | 0 | 1 | 1 | 0 | 1 | 1 |
| | | 0 | 1 | 1 | 0 | 1 | 1 | 0 | 0 |
| | | 1 | 0 | 1 | 1 | 0 | 0 | 0 | 1 |
| Fourth Address | | 1 | 1 | 0 | 0 | 0 | 1 | 1 | 0 |
| | | | | | | | | | |

Note : 1. LBO pin must be tied to High or Low, and Floating State must not be allowed.

ASYNCHRONOUS TRUTH TABLE

(See Notes 1 and 2):

| OPERATION | ZZ | OE | I/O STATUS |
|------------|----|----|-------------|
| Sleep Mode | H | X | High-Z |
| Read | L | L | DQ |
| | L | H | High-Z |
| Write | L | X | Din, High-Z |
| Deselected | L | X | High-Z |

Notes

1. X means "Don't Care".
2. ZZ pin is pulled down internally.
3. For write cycles that follow read cycles, the output buffers must be disabled with OE, otherwise data bus contention will occur.
4. Sleep Mode means power down state of which stand-by current does not depend on cycle time.
5. Deselected means power down state of which stand-by current depends on cycle time.

ELECTRONICS

- Notes :**
1. All address inputs must meet the specified setup and hold times for all rising clock edges whenever ADSC and/or ADSP is sampled low and CS is sampled low. All other synchronous inputs must meet the specified setup and hold times whenever this device is chip selected.
 2. Both chip selects must be active whenever ADSC or ADSP is sampled low in order for this device to remain enabled.
 3. ADSC or ADSP must not be asserted for at least 2 Clock after leaving ZZ state.

TIMING WAVEFORM OF READ CYCLE

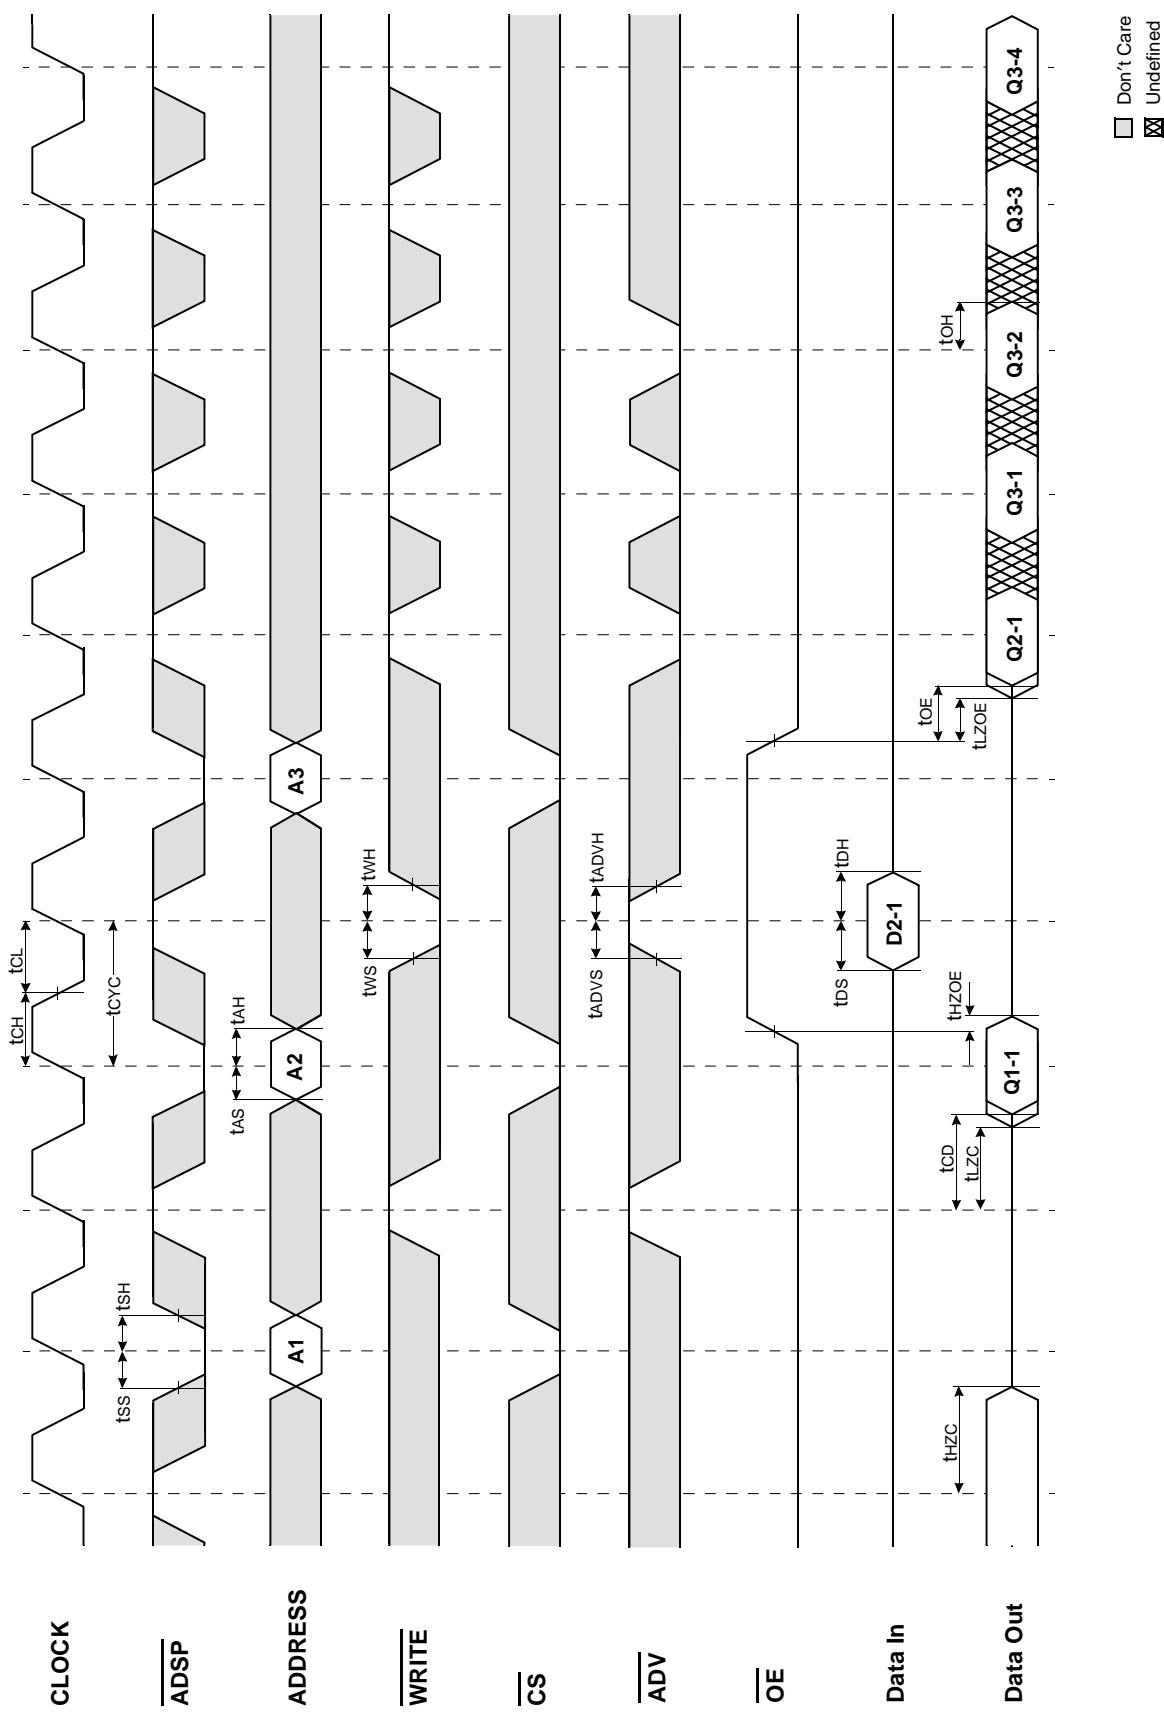

NOTES : $\overline{\text{WRITE}} = \text{L}$ means $\overline{\text{GW}} = \text{L}$, or $\overline{\text{GW}} = \text{H}$, $\overline{\text{BW}} = \text{L}$, $\overline{\text{WE}} = \text{L}$
 $\overline{\text{CS}} = \text{L}$ means $\overline{\text{CS}_1} = \text{L}$, $\text{CS}_2 = \text{H}$ and $\overline{\text{CS}_2} = \text{L}$
 $\overline{\text{CS}} = \text{H}$ means $\overline{\text{CS}_1} = \text{H}$, or $\overline{\text{CS}_2} = \text{H}$, or $\overline{\text{CS}_1} = \text{L}$, and $\overline{\text{CS}_2} = \text{L}$

TIMING WAVEFORM OF WRITE CYCLE

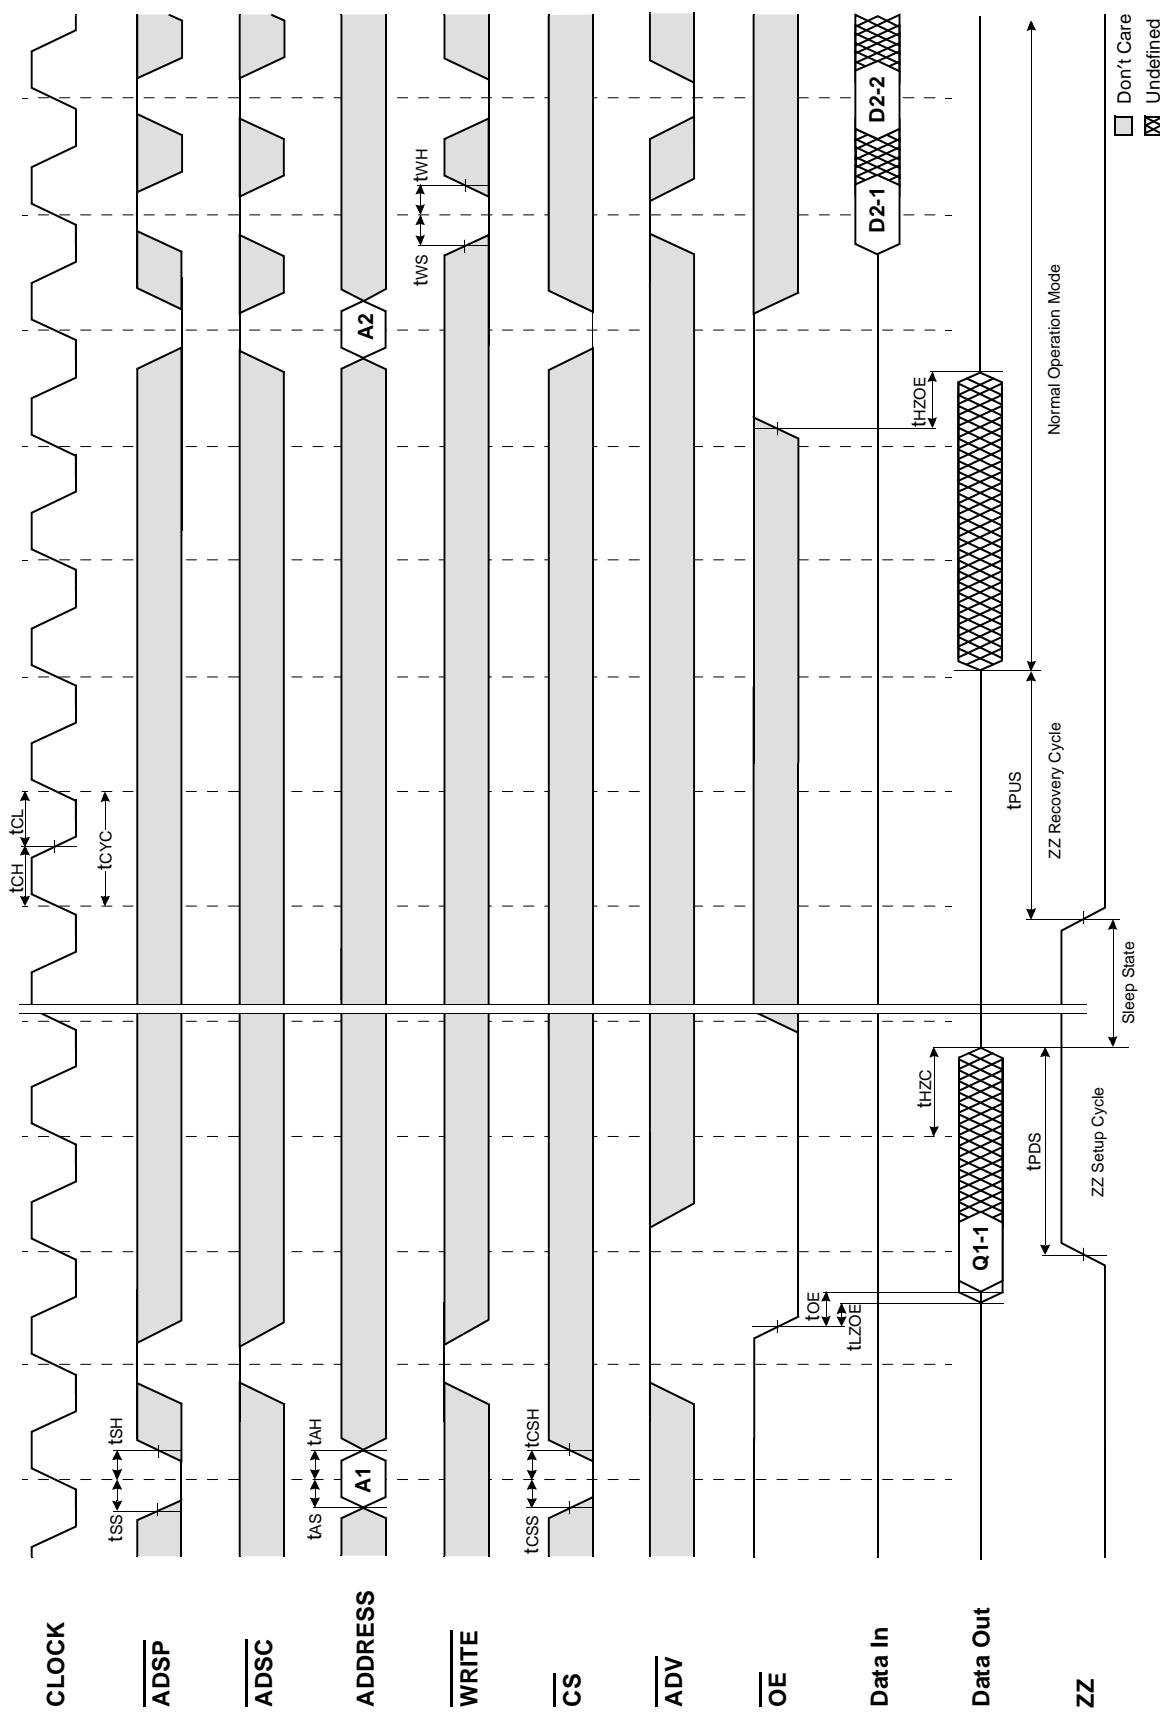

TIMING WAVEFORM OF COMBINATION READ/WRTE CYCLE(\overline{ADSP} CONTROLLED , $\overline{ADSC}=\text{HIGH}$)

TIMING WAVEFORM OF SINGLE READ/WRITE CYCLE(\overline{ADSC} CONTROLLED , \overline{ADSP} =HIGH)

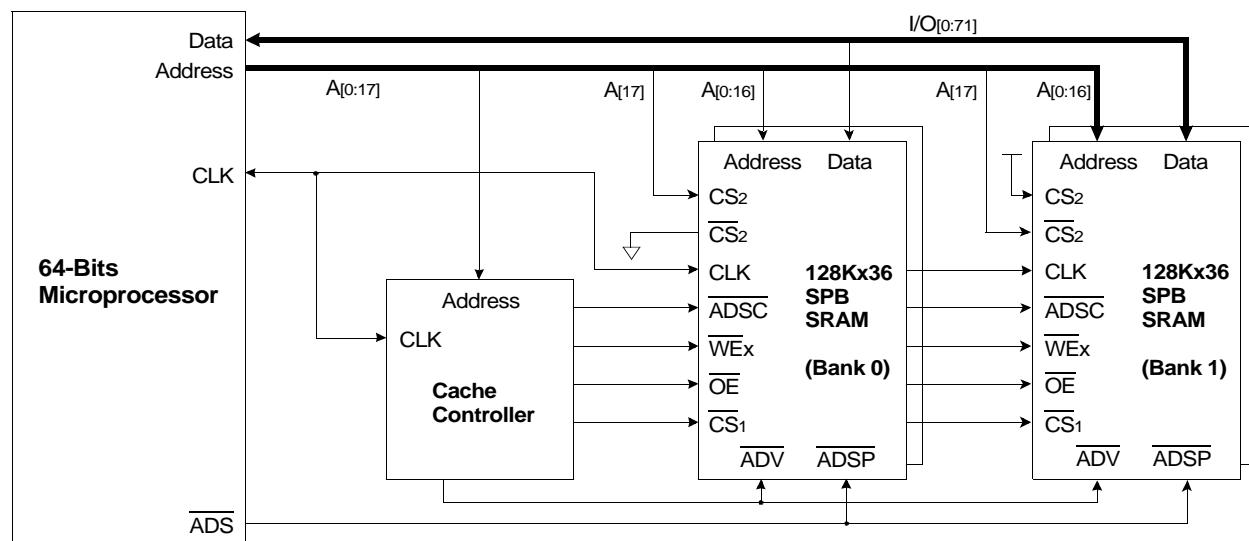

TIMING WAVEFORM OF POWER DOWN CYCLE

APPLICATION INFORMATION

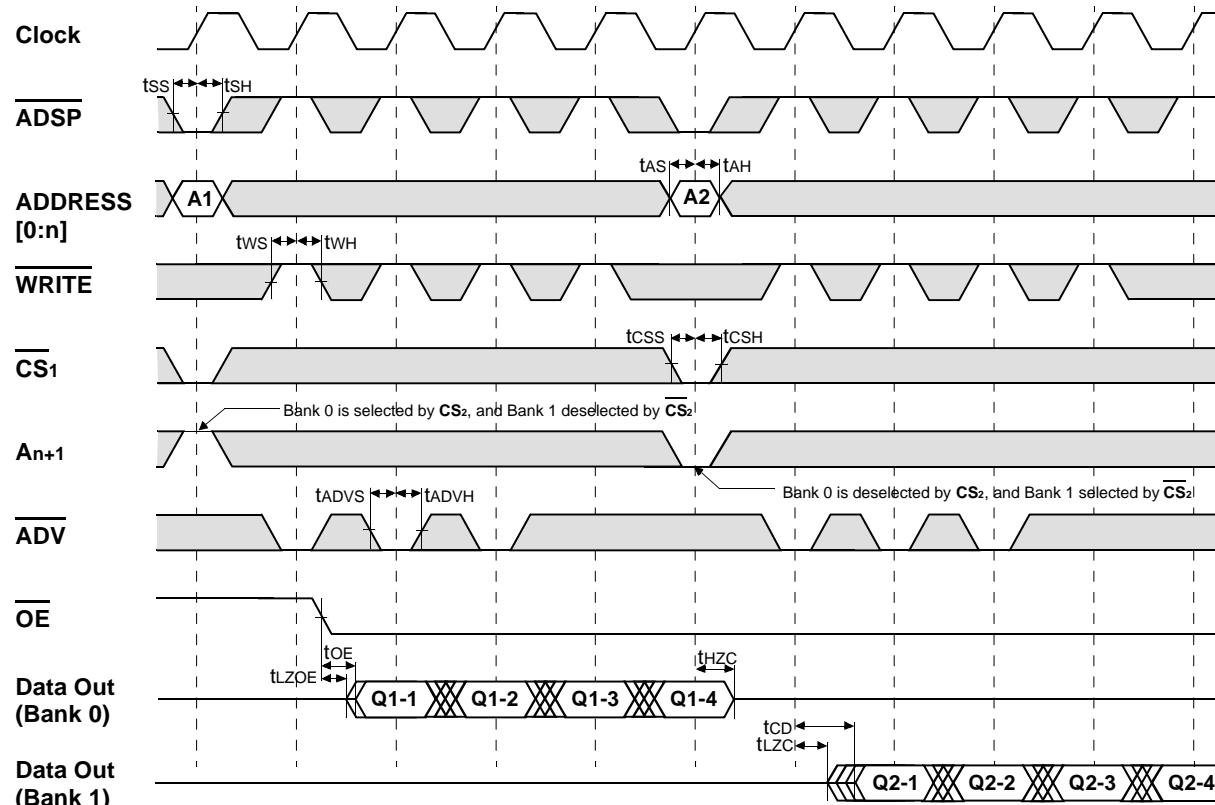

DEPTH EXPANSION

The Samsung 128Kx36 Synchronous Pipelined Burst SRAM has two additional chip selects for simple depth expansion. This permits easy secondary cache upgrades from 128K depth to 256K depth without extra logic.

INTERLEAVE READ TIMING (Refer to non-interleave write timing for interleave write timing)

(ADSP CONTROLLED , ADSC=HIGH)

*Notes :
 n = 14 32K depth
 15 64K depth
 16 128K depth
 17 256K depth
