## GENERAL DESCRIPTION

The KM23V8105D(G) is a fully static mask programmable ROM fabricated using silicon gate CMOS process technology, and is organized either as 1,048,576 x 8 bit(byte mode) or as 524,288 x 16 bit(word mode) depending on BHE voltage level.(See mode selection table)

This device includes page read mode function, page read mode allows 4 words (or 8bytes) of data to read fast in the same page,  $\overline{CE}$  and  $A_2 \sim A_{18}$  should not be changed.

This device operates with a 3.0V or 3.3V power supply, and all inputs and outputs are TTL compatible.

Because of its asynchronous operation, it requires no external clock assuring extremely easy operation.

It is suitable for use in program memory of microprocessor, and data memory, character generator.

The KM23V8105D is packaged in a 42-DIP and the KM23V8105DG in a 44-SOP.

**ABSOLUTE MAXIMUM RATINGS**

Item	Symbol	Rating	Unit
Voltage on Any Pin Relative to Vss	VIN	-0.3 to +4.5	V
Temperature Under Bias	T <sub>BIAS</sub>	-10 to +85	°C
Storage Temperature	T <sub>STG</sub>	-55 to +150	°C

**NOTE :** Permanent device damage may occur if "ABSOLUTE MAXIMUM RATINGS" are exceeded. Functional operation should be restricted to the conditions as detailed in the operational sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

**RECOMMENDED OPERATING CONDITIONS**(Voltage reference to Vss, TA=0 to 70°C)

Supply Voltage	V <sub>CC</sub>	2.7/3.0	3.0/3.3	3.3/3.6	V
Supply Voltage	V <sub>SS</sub>	0	0	0	V

**DC CHARACTERISTICS**

**NOTE :** Minimum DC Voltage(V<sub>IL</sub>) is -0.3V an input pins. During transitions, this level may undershoot to -2.0V for periods <20ns.

Maximum DC voltage on input pins(V<sub>IH</sub>) is V<sub>CC</sub>+0.3V which, during transitions, may overshoot to V<sub>CC</sub>+2.0V for periods <20ns.
