512Kx36-bit, 1Mx18-bit, 2Mx9-bit QDR™ II b2 SRAM

FEATURES

- 1.8V+0.1V/-0.1V Power Supply.
- DLL circuitry for wide output data valid window and future frequency scaling.
- I/O Supply Voltage 1.5V+0.1V/-0.1V for 1.5V I/O, 1.8V+0.1V/-0.1V for 1.8V I/O.
- Separate independent read and write data ports with concurrent read and write operation
- HSTL I/O
- Full data coherency, providing most current data .
- Synchronous pipeline read with self timed early write.
- Registered address, control and data input/output.
- DDR(Double Data Rate) Interface on read and write ports.
- Fixed 2-bit burst for both read and write operation.
- Clock-stop supports to reduce current.
- Two input clocks(K and $\bar{K}$) for accurate DDR timing at clock rising edges only.
- Two input clocks for output data(C and $\bar{C}$) to minimize clock-skew and flight-time mismatches.
- Two echo clocks (CQ and $\bar{CQ}$) to enhance output data traceability.
- Single address bus.
- Byte write (x9, x18, x36) function.
- Separate read/write control pin($\bar{R}$ and $\bar{W}$)
- Simple depth expansion with no data contention.
- Programmable output impedance.
- JTAG 1149.1 compatible test access port.
- 165FBGA(11x15 ball array FBGA) with body size of 13x15mm

GENERAL DESCRIPTION

The K7R163682B, K7R161882B and K7R160982B are 18,874,368-bits QDR(Quad Data Rate) Synchronous Pipelined Burst SRAMs.

They are organized as 524,288 words by 36bits for K7R163682B, 1,048,576 words by 18 bits for K7R161882B and 2,097,152 words by 9bits for K7R160982B.

The QDR operation is possible by supporting DDR read and write operations through separate data output and input ports with the same cycle. Memory bandwidth is maximized as data can be transferred into sram on every rising edge of K and $\overline{K}$, and transferred out of sram on every rising edge of C and $\overline{C}$. And totally independent read and write ports eliminate the need for high speed bus turn around.

Address, data inputs, and all control signals are synchronized to the input clock (K or $\overline{K}$). Normally data outputs are synchronized to output clocks (C and $\overline{C}$), but when C and $\overline{C}$ are tied high, the data outputs are synchronized to the input clocks (K and $\overline{K}$). Read data are referenced to echo clock (CQ or $\overline{CQ}$) outputs. Read address is registered on rising edges of the input K clocks, and write address is registered on rising edges of the input $\overline{K}$ clocks. Common address bus is used to access address both for read and write operations.

The internal burst counter is fixed to 2-bit sequential for both read and write operations. Synchronous pipeline read and early write enable high speed operations. Simple depth expansion is accomplished by using $\overline{R}$ and $\overline{W}$ for port selection. Byte write operation is supported with $\overline{BW_0}$ and $\overline{BW_1}$ ($\overline{BW_2}$ and $\overline{BW_3}$) pins for x18 (x36) device and only $\overline{BW}$ pin for x9 device. Nybble write operation is supported with $\overline{NW_0}$ and $\overline{NW_1}$ pins for x8 device. IEEE 1149.1 serial boundary scan (JTAG) simplifies monitoring package pads attachment status with system.

The K7R163682B, K7R161882B and K7R160982B are implemented with SAMSUNG's high performance 6T CMOS technology and is available in 165pin FBGA packages. Multiple power and ground pins minimize ground bounce.

Read Operations

Read cycles are initiated by activating $\overline{R}$ at the rising edge of the positive input clock K. Address is presented and stored in the read address register synchronized with K clock.

For 2-bit burst DDR operation, it will access two 36-bit or 18-bit or 9-bit or 8-bit data words with each read command. The first pipelined data is transferred out of the device triggered by $\overline{C}$ clock following next $\overline{K}$ clock rising edge. Next burst data is triggered by the rising edge of following C clock rising edge.

Continuous read operations are initiated with K clock rising edge. And pipelined data are transferred out of device on every rising edge of both C and $\overline{C}$ clocks. In case C and $\overline{C}$ tied to high, output data are triggered by K and $\overline{K}$ instead of C and $\overline{C}$.

When the $\overline{R}$ is disabled after a read operation, the K7R163682B, K7R161882B and K7R160982B will first complete burst read operation before entering into deselect mode at the next K clock rising edge. Then output drivers disabled automatically to high impedance state.

Echo clock operation

To assure the output traceability, the SRAM provides the output Echo clock, pair of complement clock CQ and $\overline{CQ}$, which are synchronized with internal data output. Echo clocks run free during normal operation. The Echo clock is triggered by internal output clock signal, and transferred to external through same structures as output driver.

Power-Up/Power-Down Supply Voltage Sequencing

The following power-up supply voltage application is recommended: VSS, VDD, VDDQ, VREF, then V_{IN}. VDD and VDDQ can be applied simultaneously, as long as VDDQ does not exceed VDD by more than 0.5V during power-up. The following power-down supply voltage removal sequence is recommended: V_{IN}, VREF, VDDQ, VDD, VSS. VDD and VDDQ can be removed simultaneously, as long as VDDQ does not exceed VDD by more than 0.5V during power-down.

Write Operations

Write cycles are initiated by activating $\overline{W}$ at the rising edge of the positive input clock K.
Address is presented and stored in the write address register synchronized with following $\overline{K}$ clock.

For 2-bit burst DDR operation, it will write two 36-bit or 18-bit or 9-bit or 8-bit data words with each write command.
The first "early" data is transferred and registered in to the device synchronous with same K clock rising edge with $\overline{W}$ presented.
Next burst data is transferred and registered synchronous with following $\overline{K}$ clock rising edge.

Continuous write operations are initiated with K rising edge.
And "early written" data is presented to the device on every rising edge of both K and $\overline{K}$ clocks.

When the $\overline{W}$ is disabled, the K7R163682B, K7R161882B and K7R160982B will enter into deselect mode.
The device disregards input data presented on the same cycle $\overline{W}$ disabled.

The K7R163682B, K7R161882B and K7R160982B support byte write operations.
With activating $\overline{BW_0}$ or $\overline{BW_1}$ ($\overline{BW_2}$ or $\overline{BW_3}$) in write cycle, only one byte of input data is presented.
In K7R161882B, $\overline{BW_0}$ controls write operation to D0:D8, $\overline{BW_1}$ controls write operation to D9:D17.
And in K7R163682B $\overline{BW_2}$ controls write operation to D18:D26, $\overline{BW_3}$ controls write operation to D27:D35.
And in K7R160982B $\overline{BW}$ controls write operation to D0:D8.

Programmable Impedance Output Buffer Operation

The designer can program the SRAM's output buffer impedance by terminating the ZQ pin to Vss through a precision resistor(RQ).
The value of RQ (within 15%) is five times the output impedance desired.

For example, 250Ω resistor will give an output impedance of 50 Ω.
Impedance updates occur early in cycles that do not activate the outputs, such as deselect cycles.
In all cases impedance updates are transparent to the user and do not produce access time "push-outs" or other anomalous behavior in the SRAM.

To guarantee optimum output driver impedance after power up, the SRAM needs 1024 non-read cycles.

Clock Consideration

K7R163682B, K7R161882B and K7R160982B utilizes internal DLL(Delay-Locked Loops) for maximum output data valid window.
It can be placed into a stopped-clock state to minimize power with a modest restart time of 1024 clock cycles.
Circuitry automatically resets the DLL when absence of input clock is detected.

Singel Clock Mode

K7R163682B, K7R161882B and K7R160982B can be operated with the single clock pair K and $\overline{K}$, instead of C or $\overline{C}$ for output clocks.
To operate these devices in single clock mode, C and $\overline{C}$ must be tied high during power up and must be maintained high during operation.
After power up, this device can't change to or from single clock mode.
System flight time and clock skew could not be compensated in this mode.

Depth Expansion

Separate input and output ports enables easy depth expansion.
Each port can be selected and deselected independently and read and write operation do not affect each other.
Before chip deselected, all read and write pending operations are completed.

STATE DIAGRAM

- Notes:**
1. Internal burst counter is fixed as 2-bit linear, i.e. when first address is A0+0, next internal burst address is A0+1.
 2. "READ" refers to read active status with $\overline{R}$ =Low, " $\overline{READ}$ " refers to read inactive status with $\overline{R}$ =high. "WRITE" and " $\overline{WRITE}$ " are the same case.
 3. Read and write state machine can be active simultaneously.
 4. State machine control timing sequence is controlled by K.

K	$\bar{R}$	$\bar{W}$	D		Q		OPERATION
			D(A0)	D(A1)	Q(A0)	Q(A1)	
Stopped	X	X	Previous state	Previous state	Previous state	Previous state	Clock Stop
$\uparrow$	H	H	X	X	High-Z	High-Z	No Operation
$\uparrow$	L	X	X	X	DOUT at $\bar{C}(t+1)$	DOUT at $C(t+2)$	Read
$\uparrow$	X	L	Din at K(t)	Din at $\bar{K}(t)$	X	X	Write

Notes: 1. X means "Don't Care".

2. The rising edge of clock is symbolized by ($\uparrow$).

3. Before enter into clock stop status, all pending read and write operations will be completed.

WRITE TRUTH TABLE(x18)

K	$\bar{K}$	$\bar{BW}_0$	$\bar{BW}_1$	OPERATION
$\uparrow$		L	L	WRITE ALL BYTES ($K\uparrow$)

	$\uparrow$	H	L	WRITE BYTE 1 ($\bar{K}\uparrow$)
$\uparrow$		H	H	WRITE NOTHING ($K\uparrow$)
	$\uparrow$	H	H	WRITE NOTHING ($\bar{K}\uparrow$)

Notes: 1. X means "Don't Care".

2. All inputs in this table must meet setup and hold time around the rising edge of input clock K or $\bar{K}$ ($\uparrow$).

3. Assumes a WRITE cycle was initiated.

4. This table illustrates operation for x18 devices. x9 device operation is similar except that $\bar{BW}$ controls D0:D8.

WRITE TRUTH TABLE(x36)

$\uparrow$		H	H	H	H	WRITE NOTHING ($K\uparrow$)
	$\uparrow$	H	H	H	H	WRITE NOTHING ($\bar{K}\uparrow$)

Notes: 1. X means "Don't Care".

2. All inputs in this table must meet setup and hold time around the rising edge of input clock K or $\bar{K}$ ($\uparrow$).

3. Assumes a WRITE cycle was initiated.

ABSOLUTE MAXIMUM RATINGS*

PARAMETER	SYMBOL	RATING	UNIT
Voltage on VDD Supply Relative to VSS	VDD	-0.5 to 2.9	V
Voltage on VDDQ Supply Relative to VSS	VDDQ	-0.5 to VDD	V
Voltage on Input Pin Relative to VSS	VIN	-0.5 to VDD+0.3	V
Storage Temperature	TSTG	-65 to 150	°C
Operating Temperature	TOPR	0 to 70	°C
Storage Temperature Range Under Bias	TBIAS	-10 to 85	°C

***Note:** 1. Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operating sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
2. VDDQ must not exceed VDD during normal operation.

Notes: 1. Minimum cycle. IOUT=0mA.
2. $|I_{OH}| = (V_{DDQ}/2)/(RQ/5) \pm 15\%$ for $175\Omega \leq RQ \leq 350\Omega$.
3. $|I_{OL}| = (V_{DDQ}/2)/(RQ/5) \pm 15\%$ for $175\Omega \leq RQ \leq 350\Omega$.
4. Minimum Impedance Mode when ZQ pin is connected to VDDQ.
5. Operating current is calculated with 50% read cycles and 50% write cycles.
6. Standby Current is only after all pending read and write burst operations are completed.
7. Programmable Impedance Mode.
8. These are DC test criteria. DC design criteria is VREF±50mV. The AC VIH/VIL levels are defined separately for measuring timing parameters.
9. VIL (Min)DC=-0.3V, VIL (Min)AC=-1.5V(pulse width ≤ 3ns).
10. VIH (Max)DC=VDDQ+0.3, VIH (Max)AC=VDDQ+0.85V(pulse width ≤ 3ns).

Input High Voltage	V _{IH} (AC)	V _{REF} + 0.2	-	V	1,2
Input Low Voltage	V _{IL} (AC)	-	V _{REF} - 0.2	V	1,2

Notes: 1. This condition is for AC function test only, not for AC parameter test.

2. To maintain a valid level, the transitioning edge of the input must :

- Sustain a constant slew rate from the current AC level through the target AC level, V_{L(AC)} or V_{H(AC)}
- Reach at least the target AC level
- After the AC target level is reached, continue to maintain at least the target DC level, V_{L(DC)} or V_{H(DC)}

- Notes:** 1. All address inputs must meet the specified setup and hold times for all latching clock edges.
2. Control signal are $\overline{R}$ and $\overline{W}$.
In case of BW₀, BW₁ (BW₂, BW₃, also for x36) signal follow the data setup/hold times.
3. If C, $\overline{C}$ are tied high, $\overline{K}$, $\overline{K}$ become the references for C, $\overline{C}$ timing parameters.
4. To avoid bus contention, at a given voltage and temperature tCHQX₁ is bigger than tCHQZ.
The specs as shown do not imply bus contention because tCHQX₁ is a MIN parameter that is worst case at totally different test conditions (0°C, 1.9V) than tCHQZ, which is a MAX parameter (worst case at 70°C, 1.7V).
It is not possible for two SRAMs on the same board to be at such different voltage and temperature.
5. Clock phase jitter is the variance from clock rising edge to the next expected clock rising edge.
6. Vdd slew rate must be less than 0.1V DC per 50 ns for DLL lock retention. DLL lock time begins once Vdd and input clock are stable.

Junction to Ambient	θ _{JA}	17.1	°C/W	
Junction to Case	θ _{JC}	3.3	°C/W	

Note: Junction temperature is a function of on-chip power dissipation, package thermal impedance, mounting site temperature and mounting site thermal impedance. $T_J = T_A + P_D \times \theta_{JA}$

APPLICATION INFORMATION

TIMING WAVE FORMS OF READ AND NOP

Note: 1. Q1-1 refers to output from address A1+0, Q1-2 refers to output from address A1+1 i.e. the next internal burst address following A1+0.
2. Outputs are disabled one cycle after a NOP.

TIMING WAVE FORMS OF WRITE AND NOP

Note: 1.D1-1 refers to input to address A1+0, D1-2 refers to input to address A1+1, i.e the next internal burst address following A1+0.
2. $\overline{\text{BWx}}$ ($\overline{\text{NWx}}$) assumed active.

TIMING WAVE FORMS OF READ, WRITE AND NOP

Note: 1. If address A1=A2, data Q1-1=D2-1, data Q1-2=D2-2.

Write data is forwarded immediately as read results.

2. $\overline{BWx}$ ($\overline{NWx}$) assumed active.

IEEE 1149.1 TEST ACCESS PORT AND BOUNDARY SCAN-JTAG

This part contains an IEEE standard 1149.1 Compatible Test Access Port(TAP). The package pads are monitored by the Serial Scan circuitry when in test mode. This is to support connectivity testing during manufacturing and system diagnostics. Internal data is not driven out of the SRAM under JTAG control. In conformance with IEEE 1149.1, the SRAM contains a TAP controller, Instruction Register, Bypass Register and ID register. The TAP controller has a standard 16-state machine that resets internally upon power-up, therefore, TRST signal is not required. It is possible to use this device without utilizing the TAP. To disable the TAP controller without interfacing with normal operation of the SRAM, TCK must be tied to V_{ss} to preclude mid level input. TMS and TDI are designed so an undriven input will produce a response identical to the application of a logic 1, and may be left unconnected. But they may also be tied to V_{DD} through a resistor. TDO should be left unconnected.

NOTE :

1. Places DQs in Hi-Z in order to sample all input data regardless of other SRAM inputs. This instruction is not IEEE 1149.1 compliant.
2. Places DQs in Hi-Z in order to sample all input data regardless of other SRAM inputs.
3. TDI is sampled as an input to the first ID register to allow for the serial shift of the external TDI data.
4. Bypass register is initiated to V_{ss} when BYPASS instruction is invoked. The Bypass Register also holds serially loaded TDI when exiting the Shift DR states.
5. SAMPLE instruction dose not places DQs in Hi-Z.
6. This instruction is reserved for future use.
