

THREE PHASE MOTOR DRIVER

- SUPPLY VOLTAGE FROM 7 TO 52V
- 5A PEAK CURRENT
- $R_{DS\ ON}$ 0.3 Ω TYP. VALUE AT 25°C
- CROSS CONDUCTION PROTECTION
- TTL COMPATIBLE DRIVER
- OPERATING FREQUENCY TO 50KHz
- THERMAL SHUTDOWN
- INTRINSIC FAST FREE WHEELING DIODES
- INPUT AND ENABLE FUNCTION FOR EVERY HALF BRIDGE
- 10V EXTERNAL REFERENCE AVAILABLE

DESCRIPTION

The L6234 is a triple half bridge to drive a brushless motor.

It is realized in Multipower BCD technology which combines isolated DMOS power transistors with CMOS and Bipolar circuits on the same chip.

By using mixed technology it has been possible to optimize the logic circuitry and the power stage to achieve the best possible performance.

The output DMOS transistors can sustain a very high current due to the fact that the DMOS structure is not affected by the second breakdown ef-

fect, the RMS maximum current is practically limited by the dissipation capability of the package. All the logic inputs are TTL, CMOS and μP compatible. Each channel is controlled by two separate logic input.

L6234 is available in 20 pin POWER DIP package (16+2+2) and in PowerSO20.

THERMAL CHARACTERISTICS

 $R_{th\ j-pins}$

DIP16+2+2. The thermal resistance is referred to the thermal path from the dissipating region on the top surface of the silicon chip, to the points along the four central pins of the package, at a distance of 1.5 mm away from the stand-offs.

 $R_{th\ j-amb1}$

If a dissipating surface, thick at least 35 μm , and with a surface similar or bigger than the one shown, is created making use of the printed circuit.

Such heatsinking surface is considered on the bottom side of an horizontal PCB (worst case).

 $R_{th\ j-amb2}$

If the power dissipating pins (the four central

ones), as well as the others, have a minimum thermal connection with the external world (very thin strips only) so that the dissipation takes place through still air and through the PCB itself.

It is the same situation of point above, without any heatsinking surface created on purpose on the board.

CIRCUIT DESCRIPTION

L6234 is a triple half bridge designed to drive brushless DC motors.

Each half bridge has 2 power DMOS transistors with $R_{dsON} = 0.3\Omega$. The 3 half bridges can be controlled independently by means of the 3 inputs IN1, IN2, IN3 and the 3 inputs EN1, EN2, and

EN3. An external connection to the 3 common low side DMOS sources is provided to connect a sensing resistor for constant current chopping application.

The driving stage and the logic stage are designed to work from 7V to 52V.
