## PIN FUNCTIONS

Nº	Name	Function
1	Input 1	Low Quiescent Current 50mA Regulator Input
2	Input 2	100mA Regulator Input.
3	Timing Capacitor	If Reg. 2 is switched-ON the delay capacitor is charged with a $10\mu\text{A}$ constant current. When Reg. 2 is switched-OFF the delay capacitor is discharged.
4	GND	Common Ground
5	Disable Input	A high level ( $> V_{DT}$ ) disables output Reg. 2.
6	Reset Output	When pin 3 reaches 5V the reset output is switched low. Therefore $t_{RD} = C_t \left( \frac{5V}{10\mu\text{A}} \right)$ ; $t_{RD}$ (ms) = $C_t$ (nF).
7	Output 2	5V – 100mA Regulator Output. Enabled if $V_o > V_{RT}$ . DISABLE INPUT $< V_{DT}$ and $V_{IN\ 2} > V_{IT}$ . If Reg. 2 is switched-OFF the $C_{O2}$ capacitor is discharged.
8	Output 1	5V – 50mA regulator output with low leakage in switch-OFF condition.

## **APPLICATION INFORMATION**

In power supplies for µP systems it is necessary to provide power continuously to avoid loss of information in memories and in time of day clocks, or to save data when the primary supply is removed. The L4903 makes it very easy to supply such equipments ; it provides two voltage regulators (both 5 V high precision) with separate inputs plus a reset output for the data save function and Reg. 2 disable input.

### **CIRCUIT OPERATION** (see Figure 2)

After switch on Reg. 1 saturates until  $V_{01}$  rises to the nominal value.

When the input 2 reaches  $V_{IT}$  and the output 1 is higher than  $V_{RT}$  the output 2 ( $V_{O2}$  and  $V_R$ ) switches on and the reset output ( $V_R$ ) goes low after a programmable time  $T_{RD}$  (timing capacitor).

$V_{O2}$  is switched at low level and  $V_R$  at high level when one of the following conditions occurs :

- a high level ( $> V_{DT}$ ) is applied on pin 5 ;
  - an input overvoltage ;
  - an overload on the output 1 ( $V_{O1} < V_{RT}$ ) ;
  - a switch off ( $V_{IN} \leq V_{IT} - V_{TH}$ ) ;

and they start again as before when the condition

is removed.

An overload on output 2 does not switch Reg. 2, and does not influence Reg. 1.

The V<sub>01</sub> output features :

- 5 V internal reference without voltage divider between the output and the error comparator
  - very low drop series regulator element utilizing current mirrors

permit high output impedance and then very low leakage current even in power conditions.

This output may therefore be used to supply circuits continuously, such as volatile RAMs, allowing the use of a back-up battery.

The V<sub>O2</sub> can supply other non essential 5 V circuits which may be powered down when the system is inactive, or that must be powered down to prevent uncorrect operation for supply voltages below the minimum value.

The reset output can be used as a "POWER DOWN INTERRUPT", permitting RAM access only in cor-

The disable function can be used for remote on/off control of circuits connected to the  $V_{D2}$  output.

Figure 2

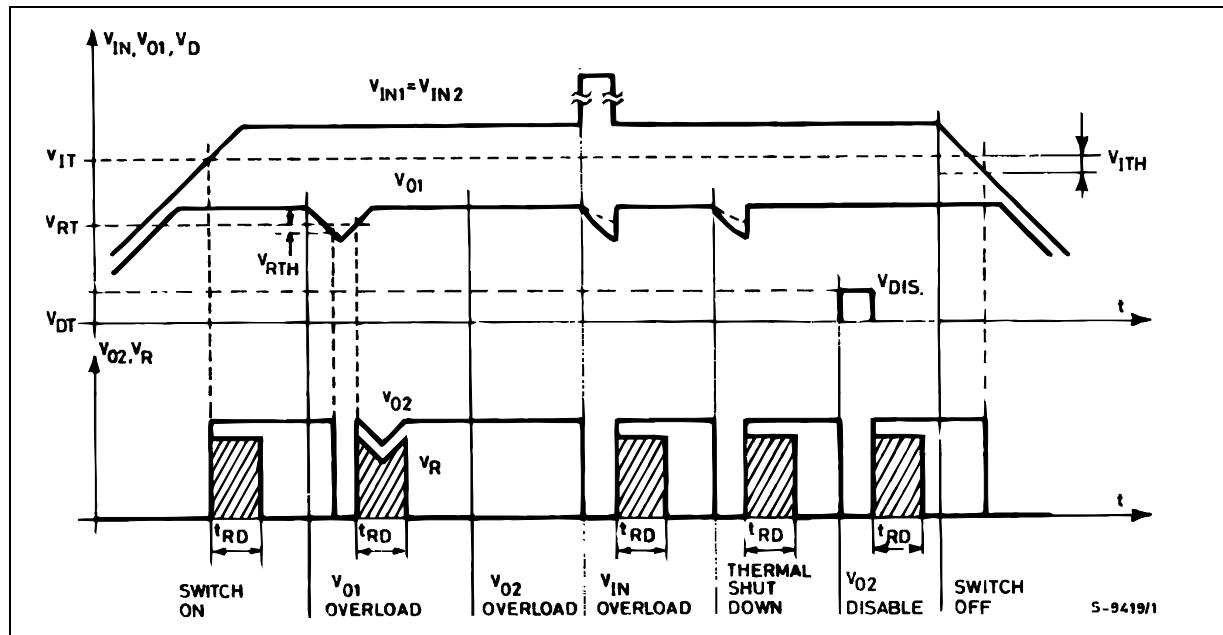

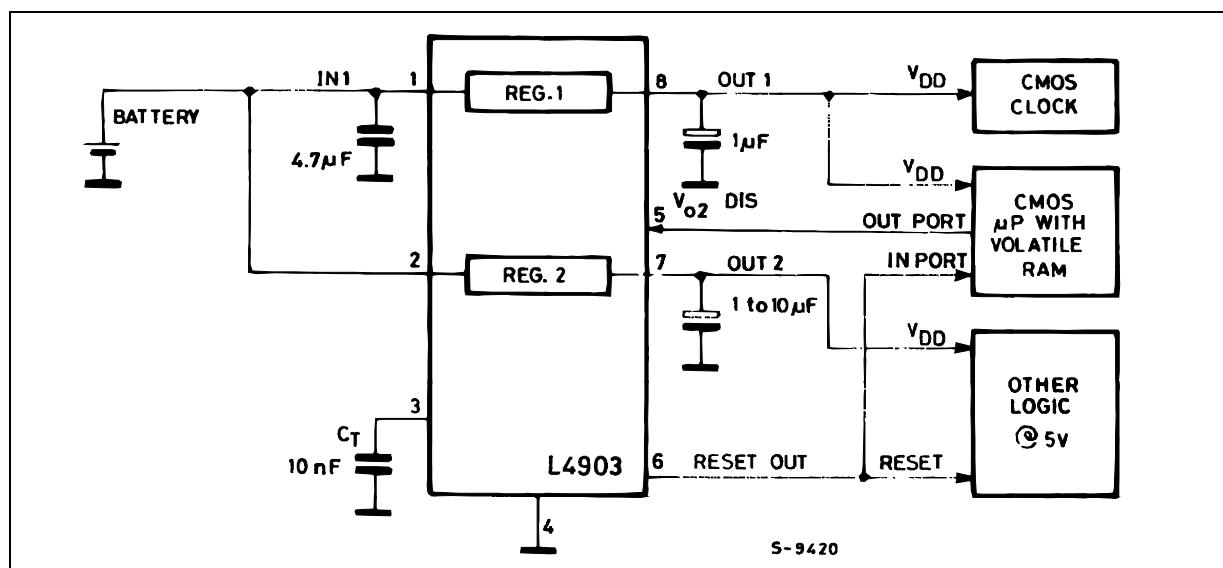

**APPLICATION SUGGESTION**

Figure 3 illustrates how the L4903's disable input may be used in a CMOS  $\mu$ Computer application. The  $V_{01}$  regulator (low consumption) supply permanently a CMOS time of day clock and a CMOS computer chip with volatile memory.  $V_{02}$  output,

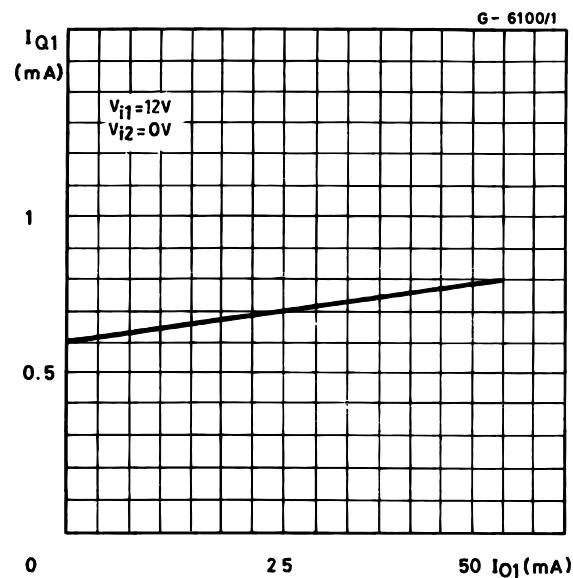

supplying non-essential circuits, is turned OFF under control of a  $\mu$ P unit.

Configurations of this type are used in products where the OFF switch is part of a keyboard scanned by a micro which operates continuously even in the OFF state.
