- When using the products covered herein, please observe the conditions written herein and the precautions outlined in the following paragraphs. In no event shall the company be liable for any damages resulting from failure to strictly adhere to these conditions and precautions.
  - (1) The products covered herein are designed and manufactured for the following application areas. When using the products covered herein for the equipment listed in Paragraph (2), even for the following application areas, be sure to observe the precautions given in Paragraph (2). Never use the products for the equipment listed in Paragraph (3).
    - Office electronics
    - Instrumentation and measuring equipment
    - Machine tools
    - Audiovisual equipment
    - Home appliance
    - Communication equipment other than for trunk lines
  - (2) Those contemplating using the products covered herein for the following equipment which demands high reliability, should first contact a sales representative of the company and then accept responsibility for incorporating into the design fail-safe operation, redundancy, and other appropriate measures for ensuring reliability and safety of the equipment and the overall system.
    - Control and safety devices for airplanes, trains, automobiles, and other transportation equipment
    - Mainframe computers
    - Traffic control systems
    - Gas leak detectors and automatic cutoff devices
    - Rescue and security equipment
    - Other safety devices and safety equipment, etc.
  - (3) Do not use the products covered herein for the following equipment which demands extremely high performance in terms of functionality, reliability, or accuracy.
    - Aerospace equipment
    - Communications equipment for trunk lines
    - Control equipment for the nuclear power industry
    - Medical equipment related to life support, etc.
  - (4) Please direct all queries and comments regarding the interpretation of the above three Paragraphs to a sales representative of the company.
- Please direct all queries regarding the products covered herein to a sales representative of the company.

## 1. Description

The LRS1383F is a combination memory organized as 2,097,152 x16 bit flash memory and 524,288 x16 bit static RAM in one package.

### Features

- Power supply • • • • 2.7V to 3.3V
- Operating temperature • • • • -25°C to +85°C
- Not designed or rated as radiation hardened
- 72pin CSP (LCSP072-P-0811) plastic package
- Flash memory has P-type bulk silicon, and SRAM has P-type bulk silicon

### Flash Memory

- Access Time • • • • 85 ns (Max.)
- Power supply current (The current for F-V<sub>CC</sub> pin and F-V<sub>PP</sub> pin)
  - Read • • • • 25 mA (Max. t<sub>CYCLE</sub> = 200ns, CMOS Input)
  - Word write • • • • 60 mA (Max.)
  - Block erase • • • • 30 mA (Max.)
  - Reset Power-Down • • • • 25 μA (Max. F- $\overline{\text{RST}}$  = GND ± 0.2V,  
I<sub>OUT</sub> (F-RY/ $\overline{\text{BY}}$ ) = 0mA)
  - Standby • • • • 25 μA (Max. F- $\overline{\text{CE}}$  = F- $\overline{\text{RST}}$  = F-V<sub>CC</sub> ± 0.2V)
- Optimized Array Blocking Architecture
  - Eight 4K-word Parameter Blocks
  - Sixty-Three 32K-word Main Blocks
  - Bottom Parameter Location
- Extended Cycling Capability
  - 100,000 Block Erase Cycles (F-V<sub>PP</sub> = 1.65V to 3.3V)
  - 1,000 Block Erase Cycles and total 80 hours (F-V<sub>PP</sub> = 11.7V to 12.3V)
- Enhanced Automated Suspend Options
  - Word Write Suspend to Read
  - Block Erase Suspend to Word Write
  - Block Erase Suspend to Read

### SRAM

- Access Time • • • • 70 ns (Max.)
- Power Supply current
  - Operating current • • • • 50 mA (Max. t<sub>RC</sub>, t<sub>WC</sub> = Min.)
  - • • • 8 mA (Max. t<sub>RC</sub>, t<sub>WC</sub> = 1μs, CMOS Input)
  - Standby current • • • • 25 μA (Max.)
  - Data retention current • • • • 25 μA (Max. S-V<sub>CC</sub> = 3.0V)

## 2. Pin Configuration

Note) From T1 to T3 pins are needed to be open.  
 Two NC pins at the corner are connected.  
 Do not float any GND pins.

Pin	Description	Type
A <sub>0</sub> to A <sub>16</sub> , A <sub>18</sub>	Address Inputs (Common)	Input
F-A <sub>17</sub> , F-A <sub>19</sub> , F-A <sub>20</sub>	Address Inputs (Flash)	Input
S-A <sub>17</sub>	Address Input (SRAM)	Input
F- $\overline{\text{CE}}$	Chip Enable Input (Flash)	Input

	Write	5,6							X	L	(9)		
Standby	Standby	5	H	H	X	X	(8)		X	X	(8)		High-Z
Reset Power Down		5,6	X	L									

Notes:

1. L = V<sub>IL</sub>, H = V<sub>IH</sub>, X = H or L, High-Z = High impedance. Refer to the DC Characteristics.
2. Command writes involving block erase, (page buffer) program are reliably executed when F-V<sub>PP</sub> = V<sub>PPH1/2</sub> and F-V<sub>CC</sub> = 2.7V to 3.3V.  
Command writes involving full chip erase is reliably executed when F-V<sub>PP</sub> = V<sub>PPH1</sub> and F-V<sub>CC</sub> = 2.7V to 3.3V.  
Block erase, full chip erase, (page buffer) program with F-V<sub>PP</sub> < V<sub>PPH1/2</sub> (Min.) produce spurious results and should not be attempted.
3. Never hold F- $\overline{\text{OE}}$  low and F- $\overline{\text{WE}}$  low at the same timing.
4. Refer Section 5. Command Definitions for Flash Memory valid D<sub>IN</sub> during a write operation.
5. F- $\overline{\text{WP}}$  set to V<sub>IL</sub> or V<sub>IH</sub>.
6. Electricity consumption of Flash Memory is lowest when F- $\overline{\text{RST}}$  = GND ±0.2V.

## 7. Flash Read Mode

H	L	High-Z	D <sub>OUT</sub> /D <sub>IN</sub>

3.2 Simultaneous Operation Modes Allowed with Four Planes<sup>(1, 2)</sup>

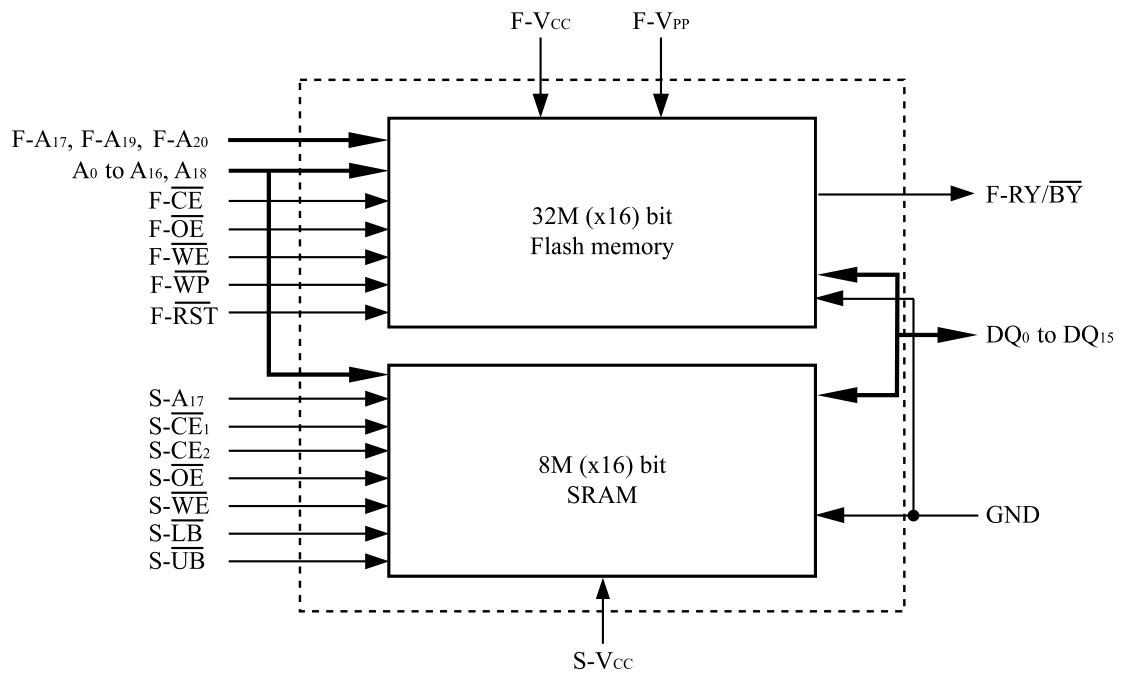

IF ONE PARTITION IS:	THEN THE MODES ALLOWED IN THE OTHER PARTITION IS:									
	Read Array	Read ID	Read Status	Read Query	Word Program	Page Buffer Program	Block Erase	Full Chip Erase	Program Suspend	Block Erase Suspend
Read Array	X	X	X	X	X	X	X		X	X
Read ID	X	X	X	X	X	X	X		X	X
Read Status	X	X	X	X	X	X	X	X	X	X
Read Query	X	X	X	X	X	X	X		X	X
Word Program	X	X	X	X						X
Page Buffer Program	X	X	X	X						X
Block Erase	X	X	X	X						
Full Chip Erase			X							
Program Suspend	X	X	X	X						X
Block Erase Suspend	X	X	X	X	X	X			X	

## Notes:

1. "X" denotes the operation available.
2. Configurative Partition Dual Work Restrictions:  
 Status register reflects partition state, not WSM (Write State Machine) state - this allows a status register for each partition.  
 Only one partition can be erased or programmed at a time - no command queuing.  
 Commands must be written to an address within the block targeted by that command.

## Notes:

- Bus operations are defined in 3.1 Bus Operation.
- The address which is written at the first bus cycle should be the same as the address which is written at the second bus cycle.  
X=Any valid address within the device.  
PA=Address within the selected partition.  
IA=Identifier codes address (See 5.2 Identifier Codes for Read Operation).  
QA=Query codes address. Refer to the LH28F320BF, LH28F640BF, LH28F128BF series Appendix for details.  
BA=Address within the block being erased, set/cleared block lock bit or set block lock-down bit.  
WA=Address of memory location for the Program command or the first address for the Page Buffer Program command.  
PCRC=Partition configuration register code presented on the address A<sub>0</sub>-A<sub>15</sub>.
- ID=Data read from identifier codes (See 5.2 Identifier Codes for Read Operation).  
QD=Data read from query database. Refer to the LH28F320BF, LH28F640BF, LH28F128BF series Appendix for details.  
SRD=Data read from status register. See 6. Status Register Definition for a description of the status register bits.  
WD=Data to be programmed at location WA. Data is latched on the rising edge of F-WE or F-CE (whichever goes high first).  
N-1=N is the number of the words to be loaded into a page buffer.
- Following the Read Identifier Codes command, read operations access manufacturer code, device code, block lock configuration code, partition configuration register code (See 5.2 Identifier Codes for Read Operation).  
The Read Query command is available for reading CFI (Common Flash Interface) information.
- Block erase, full chip erase or (page buffer) program cannot be executed when the selected block is locked. Unlocked block can be erased or programmed when F-RST is V<sub>IH</sub>.
- Either 40H or 10H are recognized by the CUI (Command User Interface) as the program setup.
- Following the third bus cycle, inputs the program sequential address and write data of "N" times. Finally, input the any valid address within the target partition to be programmed and the confirm command (D0H). Refer to the LH28F320BF, LH28F640BF, LH28F128BF series Appendix for details.

8. If the program operation in one partition is suspended and the erase operation in other partition is also suspended, the suspended program operation should be resumed first, and then the suspended erase operation should be resumed next.
9. Full chip erase operation can not be suspended.
10. Following the Clear Block Lock Bit command, block which is not locked-down is unlocked when  $F\text{-}\overline{WP}$  is  $V_{IL}$ .  
When  $F\text{-}\overline{WP}$  is  $V_{IH}$ , lock-down bit is disabled and the selected block is unlocked regardless of lock-down configuration.
11. Commands other than those shown above are reserved by SHARP for future device implementations and should not be used.

## 5.2 Identifier Codes for Read Operation

	Code	Address [A <sub>15</sub> -A <sub>0</sub> ] <sup>(4)</sup>	Data [DQ <sub>15</sub> -DQ <sub>0</sub> ]	Notes
Manufacturer Code	Manufacturer Code	0000H	00B0H	
Device Code	32M Bottom Parameter Device Code	0001H	00B5H	1
Block Lock Configuration Code	Block is Unlocked	Block Address + 2	DQ <sub>0</sub> = 0	2
	Block is Locked		DQ <sub>0</sub> = 1	2
	Block is not Locked-Down		DQ <sub>1</sub> = 0	2
	Block is Locked-Down		DQ <sub>1</sub> = 1	2
Device Configuration Code	Partition Configuration Register	0006H	PCRC	3

Notes:

1. Bottom parameter device has its parameter blocks in the plane 0 (The lowest address).
2. DQ<sub>15</sub>-DQ<sub>2</sub> is reserved for future implementation.
3. PCRC=Partition Configuration Register Code.
4. The address A<sub>20</sub>-A<sub>16</sub> are shown in below table for reading the manufacturer, device, lock configuration, device configuration code.  
The address to read the identifier codes is dependent on the partition which is selected when writing the Read Identifier Codes command (90H).  
See Chapter 6. Partition Configuration Register Definition (P.15) for the partition configuration register.

## Identifier Codes for Read Operation on Partition Configuration (32M-bit device)

Partition Configuration Register			Address (32M-bit device) [A <sub>20</sub> -A <sub>16</sub> ]
PCR.10	PCR.9	PCR.8	
0	0	0	00H
0	0	1	00H or 08H
0	1	0	00H or 10H
1	0	0	00H or 18H
0	1	1	00H or 08H or 10H
1	1	0	00H or 10H or 18H

## 5.3 Functions of Block Lock and Block Lock-Down

Current State					Erase/Program Allowed <sup>(2)</sup>
State	F- $\overline{\text{WP}}$	DQ <sub>1</sub> <sup>(1)</sup>	DQ <sub>0</sub> <sup>(1)</sup>	State Name	
[000]	0	0	0	Unlocked	Yes
[001] <sup>(3)</sup>	0	0	1	Locked	No
[011]	0	1	1	Locked-down	No
[100]	1	0	0	Unlocked	Yes
[101] <sup>(3)</sup>	1	0	1	Locked	No
[110] <sup>(4)</sup>	1	1	0	Lock-down Disable	Yes
[111]	1	1	1	Lock-down Disable	No

Notes:

1. DQ<sub>0</sub> = 1: a block is locked; DQ<sub>0</sub> = 0: a block is unlocked.  
DQ<sub>1</sub> = 1: a block is locked-down; DQ<sub>1</sub> = 0: a block is not locked-down.
2. Erase and program are general terms, respectively, to express: block erase, full chip erase and (page buffer) program operations.
3. At power-up or device reset, all blocks default to locked state and are not locked-down, that is, [001] (F- $\overline{\text{WP}}$  = 0) or [101] (F- $\overline{\text{WP}}$  = 1), regardless of the states before power-off or reset operation.
4. When F- $\overline{\text{WP}}$  is driven to V<sub>IL</sub> in [110] state, the state changes to [011] and the blocks are automatically locked.

5.4 Block Locking State Transitions upon Command Write<sup>(4)</sup>

Current State				Result after Lock Command Written (Next State)		
State	F- $\overline{\text{WP}}$	DQ <sub>1</sub>	DQ <sub>0</sub>	Set Lock <sup>(1)</sup>	Clear Lock <sup>(1)</sup>	Set Lock-down <sup>(1)</sup>
[000]	0	0	0	[001]	No Change	[011] <sup>(2)</sup>
[001]	0	0	1	No Change <sup>(3)</sup>	[000]	[011]
[011]	0	1	1	No Change	No Change	No Change
[100]	1	0	0	[101]	No Change	[111] <sup>(2)</sup>
[101]	1	0	1	No Change	[100]	[111]
[110]	1	1	0	[111]	No Change	[111] <sup>(2)</sup>
[111]	1	1	1	No Change	[110]	No Change

Notes:

1. “Set Lock” means Set Block Lock Bit command, “Clear Lock” means Clear Block Lock Bit command and “Set Lock-down” means Set Block Lock-Down Bit command.
2. When the Set Block Lock-Down Bit command is written to the unlocked block (DQ<sub>0</sub> = 0), the corresponding block is locked-down and automatically locked at the same time.
3. “No Change” means that the state remains unchanged after the command written.
4. In this state transitions table, assumes that F- $\overline{\text{WP}}$  is not changed and fixed V<sub>IL</sub> or V<sub>IH</sub>.

5.5 Block Locking State Transitions upon  $F\text{-}\overline{WP}$  Transition<sup>(4)</sup>

Previous State	Current State				Result after $F\text{-}\overline{WP}$ Transition (Next State)	
	State	$F\text{-}\overline{WP}$	$DQ_1$	$DQ_0$	$F\text{-}\overline{WP} = 0 \rightarrow 1^{(1)}$	$F\text{-}\overline{WP} = 1 \rightarrow 0^{(1)}$
-	[000]	0	0	0	[100]	-
-	[001]	0	0	1	[101]	-
[110] <sup>(2)</sup>	[011]	0	1	1	[110]	-
Other than [110] <sup>(2)</sup>					[111]	-
-	[100]	1	0	0	-	[000]
-	[101]	1	0	1	-	[001]
-	[110]	1	1	0	-	[011] <sup>(3)</sup>
-	[111]	1	1	1	-	[011]

Notes:

1. " $F\text{-}\overline{WP} = 0 \rightarrow 1$ " means that  $F\text{-}\overline{WP}$  is driven to  $V_{IH}$  and " $F\text{-}\overline{WP} = 1 \rightarrow 0$ " means that  $F\text{-}\overline{WP}$  is driven to  $V_{IL}$ .
2. State transition from the current state [011] to the next state depends on the previous state.
3. When  $F\text{-}\overline{WP}$  is driven to  $V_{IL}$  in [110] state, the state changes to [011] and the blocks are automatically locked.
4. In this state transitions table, assumes that lock configuration commands are not written in previous, current and next state.

## Notes:

Status Register indicates the status of the partition, not WSM (Write State Machine). Even if the SR.7 is "1", the WSM may be occupied by the other partition when the device is set to 2, 3 or 4 partitions configuration.

Check SR.7 or F-RY/ $\overline{\text{BY}}$  to determine block erase, full chip erase, (page buffer) program completion. SR.6 - SR.1 are invalid while SR.7 = "0".

If both SR.5 and SR.4 are "1"s after a block erase, full chip erase, page buffer program, set/clear block lock bit, set block lock-down bit or set partition configuration register attempt, an improper command sequence was entered.

SR.3 does not provide a continuous indication of F-V<sub>pp</sub> level. The WSM interrogates and indicates the F-V<sub>pp</sub> level only after Block Erase, Full Chip Erase, (Page Buffer) Program command sequences. SR.3 is not guaranteed to report accurate feedback when F-V<sub>pp</sub> ≠ V<sub>PPH1/2</sub> or V<sub>PPLK</sub>.

SR.1 does not provide a continuous indication of block lock bit. The WSM interrogates the block lock bit only after Block Erase, Full Chip Erase, (Page Buffer) Program command sequences. It informs the system, depending on the attempted operation, if the block lock bit is set. Reading the block lock configuration codes after writing the Read Identifier Codes command indicates block lock bit status.

SR.15 - SR.8 and SR.0 are reserved for future use and should be masked out when polling the status register.

XSR.6-0 = RESERVED FOR FUTURE ENHANCEMENTS (R)

## Notes:

After issue a Page Buffer Program command (E8H), XSR.7="1" indicates that the entered command is accepted. If XSR.7 is "0", the command is not accepted and a next Page Buffer Program command (E8H) should be issued again to check if page buffer is available or not.

XSR.15-8 and XSR.6-0 are reserved for future use and should be masked out when polling the extended status register.

## Notes:

- V<sub>CC</sub> includes both F-V<sub>CC</sub> and S-V<sub>CC</sub>.
- All currents are in RMS unless otherwise noted. Typical values are the reference values at V<sub>CC</sub> = 3.0V and T<sub>A</sub> = +25°C unless V<sub>CC</sub> is specified.
- I<sub>CCWS</sub> and I<sub>CCES</sub> are specified with the device de-selected. If read or (page buffer) program while in block erase suspend mode, the device's current draw is the sum of I<sub>CCWS</sub> or I<sub>CCES</sub> and I<sub>CCR</sub> or I<sub>CCW</sub>, respectively.
- Block erase, full chip erase, (page buffer) program are inhibited when F-V<sub>PP</sub> ≤ V<sub>PPLK</sub>, and not guaranteed in the range between V<sub>PPLK</sub> (max.) and V<sub>PPH1</sub> (min.), between V<sub>PPH1</sub> (max.) and V<sub>PPH2</sub> (min.) and above V<sub>PPH2</sub> (max.).
- The Automatic Power Savings (APS) feature automatically places the device in power save mode after read cycle completion. Standard address access timings (t<sub>AVQV</sub>) provide new data when addresses are changed.
- Sampled, not 100% tested.
- F-V<sub>PP</sub> is not used for power supply pin. With F-V<sub>PP</sub> ≤ V<sub>PPLK</sub>, block erase, full chip erase, (page buffer) program cannot be executed and should not be attempted.  
Applying 12V ±0.3V to F-V<sub>PP</sub> provides fast erasing or fast programming mode. In this mode, F-V<sub>PP</sub> is power supply pin and supplies the memory cell current for block erasing and (page buffer) programming. Use similar power supply trace widths and layout considerations given to the V<sub>CC</sub> power bus.  
Applying 12V ±0.3V to F-V<sub>PP</sub> during erase/program can only be done for a maximum of 1000 cycles on each block.  
F-V<sub>PP</sub> may be connected to 12V ±0.3V for a total of 80 hours maximum.
- The operating current in dual work is the sum of the operating current (read, erase, program) in each plane.
- Includes F-RY/ $\overline{\text{BY}}$ .

## Notes:

1. The timing characteristics for reading the status register during block erase, full chip erase, (page buffer) program operations are the same as during read-only operations. See the AC Characteristics for read cycle.
2. A write operation can be initiated and terminated with either F- $\overline{\text{CE}}$  or F- $\overline{\text{WE}}$ .
3. Sampled, not 100% tested.
4. Write pulse width (t<sub>WP</sub>) is defined from the falling edge of F- $\overline{\text{CE}}$  or F- $\overline{\text{WE}}$  (whichever goes low last) to the rising edge of F- $\overline{\text{CE}}$  or F- $\overline{\text{WE}}$  (whichever goes high first). Hence, t<sub>WP</sub>=t<sub>WLWH</sub>=t<sub>LEH</sub>=t<sub>WLEH</sub>=t<sub>ELWH</sub>.
5. Write pulse width high (t<sub>WPH</sub>) is defined from the rising edge of F- $\overline{\text{CE}}$  or F- $\overline{\text{WE}}$  (whichever goes high first) to the falling edge of F- $\overline{\text{CE}}$  or F- $\overline{\text{WE}}$  (whichever goes low last). Hence, t<sub>WPH</sub>=t<sub>WHWL</sub>=t<sub>EHEL</sub>=t<sub>WHEL</sub>=t<sub>EHWL</sub>.
6. F-V<sub>PP</sub> should be held at F-V<sub>PP</sub>=V<sub>PPH1/2</sub> until determination of block erase, (page buffer) program success (SR.1/3/4/5=0) and held at F-V<sub>PP</sub>=V<sub>PPH1</sub> until determination of full chip erase success (SR.1/3/5=0).

## Notes:

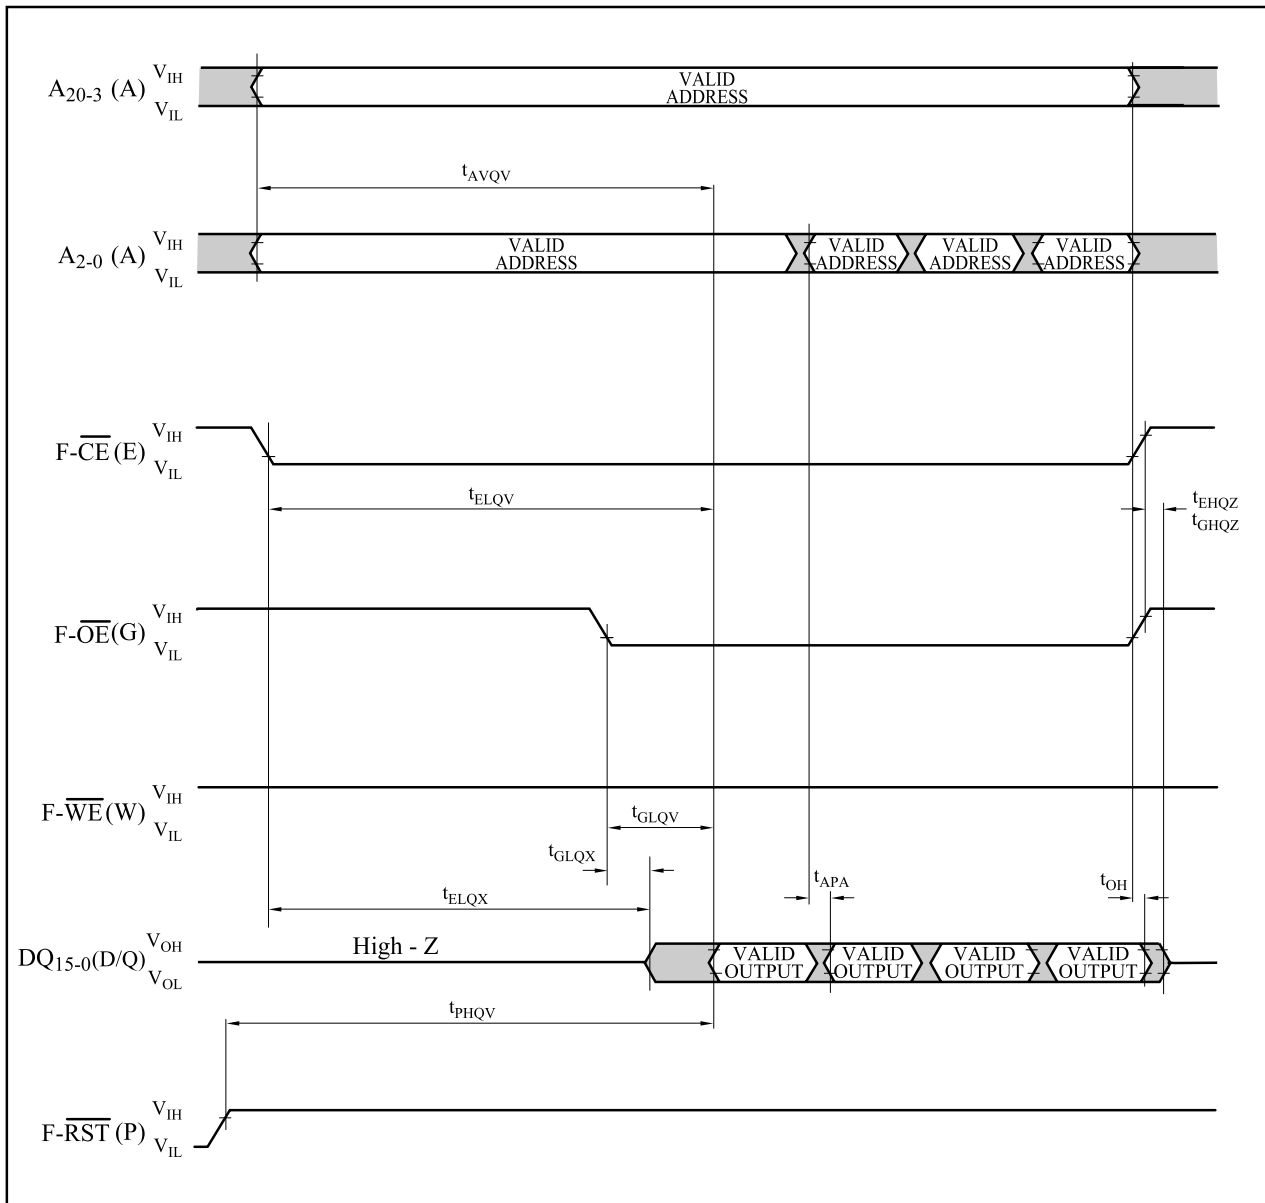

1. Typical values measured at F-V<sub>CC</sub> = 3.0V, F-V<sub>PP</sub> = 3.0V or 12V, and T<sub>A</sub> = +25°C. Assumes corresponding lock bits are not set. Subject to change based on device characterization.
2. Excludes external system-level overhead.
3. Sampled, but not 100% tested.
4. A latency time is required from writing suspend command (F- $\overline{\text{WE}}$  or F- $\overline{\text{CE}}$  going high) until SR.7 going "1" or F-RY/ $\overline{\text{BY}}$  going High-Z.
5. If the interval time from a Block Erase Resume command to a subsequent Block Erase Suspend command is shorter than t<sub>ERES</sub> and its sequence is repeated, the block erase operation may not be finished.

## Notes:

1. F-VCC power-up and standby.
2. Write each first cycle command.
3. Write each second cycle command or valid address and data.
4. Automated erase or program delay.
5. Read status register data.
6. For read operation, F- $\overline{\text{OE}}$  and F- $\overline{\text{CE}}$  must be driven active, and F- $\overline{\text{WE}}$  de-asserted.

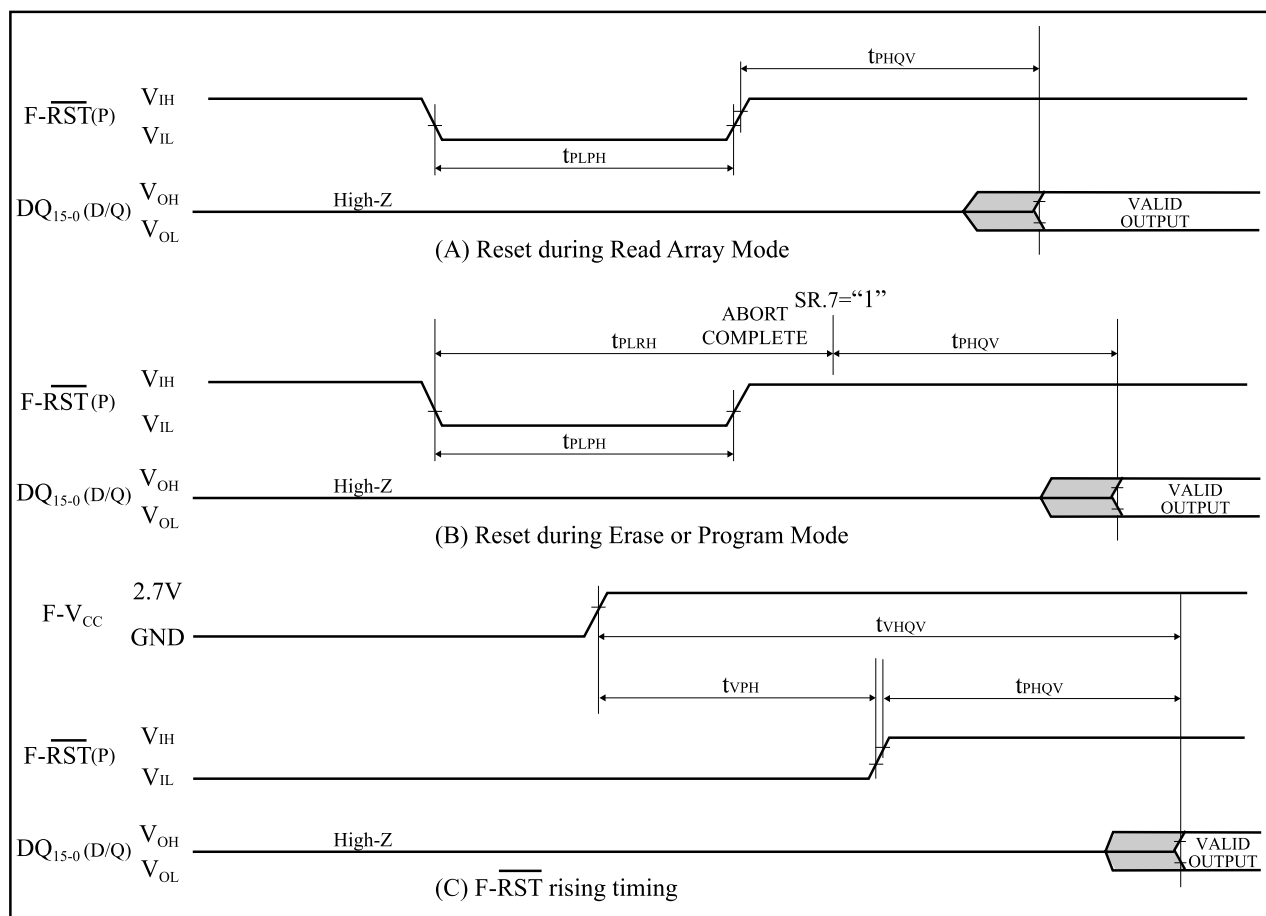

## 12.6 Reset Operations

(T<sub>A</sub> = -25°C to +85°C, F-V<sub>CC</sub> = 2.7V to 3.3V)

Symbol	Parameter	Notes	Min.	Max.	Unit
t <sub>PLPH</sub>	F- $\overline{\text{RST}}$ Low to Reset during Read (F- $\overline{\text{RST}}$ should be low during power-up.)	1, 2, 3	100		ns

t <sub>VHQP</sub>	F-V <sub>CC</sub> 2.7V to Output Delay	3		1	ms

## Notes:

1. A reset time, t<sub>PHQP</sub>, is required from the later of SR.7 (F-RY/ $\overline{\text{BY}}$ ) going "1" (High-Z) or F- $\overline{\text{RST}}$  going high until outputs are valid. See the AC Characteristics - read cycle for t<sub>PHQP</sub>.
2. t<sub>PLPH</sub> is <100ns the device may still reset but this is not guaranteed.
3. Sampled, not 100% tested.
4. If F- $\overline{\text{RST}}$  asserted while a block erase, full chip erase or (page buffer) program operation is not executing, the reset will complete within 100ns.
5. When the device power-up, holding F- $\overline{\text{RST}}$  low minimum 100ns is required after F-V<sub>CC</sub> has been in predefined range and also has been in stable there.

Read Cycle Timing Chart

Write Cycle Timing Chart (S-WE Controlled)

## Notes:

1. A write occurs during the overlap of a low S-CE<sub>1</sub>, a high S-CE<sub>2</sub> and a low S-WE.  
A write begins at the latest transition among S-CE<sub>1</sub> going low, S-CE<sub>2</sub> going high and S-WE going low.  
A write ends at the earliest transition among S-CE<sub>1</sub> going high, S-CE<sub>2</sub> going low and S-WE going high.  
 $t_{WP}$  is measured from the beginning of write to the end of write.
2.  $t_{CW}$  is measured from the later of S-CE<sub>1</sub> going low or S-CE<sub>2</sub> going high to the end of write.
3.  $t_{BW}$  is measured from the time of going low S-UB or low S-LB to the end of write.
4.  $t_{AS}$  is measured from the address valid to beginning of write.
5.  $t_{WR}$  is measured from the end of write to the address change.  $t_{WR}$  applies in case a write ends at S-CE<sub>1</sub> going high, S-CE<sub>2</sub> going low or S-WE going high.
6. During this period DQ pins are in the output state, therefore the input signals of opposite phase to the outputs must not be applied.
7. If S-CE<sub>1</sub> goes low or S-CE<sub>2</sub> goes high simultaneously with S-WE going low or after S-WE going low, the outputs remain in high impedance state.
8. If S-CE<sub>1</sub> goes high or S-CE<sub>2</sub> goes low simultaneously with S-WE going high or before S-WE going high, the outputs remain in high impedance state.

## 15. Notes

This product is a stacked CSP package that a 32M (x16) bit Flash Memory and a 8M (x16) bit SRAM are assembled into.

- Supply Power

Maximum difference (between F- $V_{CC}$  and S- $V_{CC}$ ) of the voltage is less than 0.3V.

- Power Supply and Chip Enable of Flash Memory and SRAM (F- $\overline{CE}$ , S- $\overline{CE}_1$ , S- $CE_2$ )

S- $\overline{CE}_1$  should not be “low” and S- $CE_2$  should not be “high” when F- $\overline{CE}$  is “low” simultaneously.

If the two memories are active together, possibly they may not operate normally by interference noises or data collision on DQ bus.

Both F- $V_{CC}$  and S- $V_{CC}$  are needed to be applied by the recommended supply voltage at the same time except SRAM data retention mode.

- Power Up Sequence

When turning on Flash memory power supply, keep F- $\overline{RST}$  “low”. After F- $V_{CC}$  reaches over 2.7V, keep F- $\overline{RST}$  “low” for more than 100 nsec.

- Device Decoupling

The power supply is needed to be designed carefully because one of the SRAM and the Flash Memory is in standby mode when the other is active. A careful decoupling of power supplies is necessary between SRAM and Flash Memory. Note peak current caused by transition of control signals (F- $\overline{CE}$ , S- $\overline{CE}_1$ , S- $CE_2$ ).

## 16. Flash Memory Data Protection

Noises having a level exceeding the limit specified in the specification may be generated under specific operating conditions on some systems. Such noises, when induced onto F- $\overline{\text{WE}}$  signal or power supply, may be interpreted as false commands and causes undesired memory updating. To protect the data stored in the flash memory against unwanted writing, systems operating with the flash memory should have the following write protect designs, as appropriate:

■ The below describes data protection method.

### 1. Protection of data in each block

- Any locked block by setting its block lock bit is protected against the data alternation. When F- $\overline{\text{WP}}$  is low, any locked-down block by setting its block lock-down bit is protected from lock status changes.  
By using this function, areas can be defined, for example, program area (locked blocks), and data area (unlocked blocks).
- For detailed block locking scheme, see Chapter 5.Command Definitions for Flash Memory.

### 2. Protection of data with F- $V_{\text{PP}}$ control

- When the level of F- $V_{\text{PP}}$  is lower than  $V_{\text{PPLK}}$  (F- $V_{\text{PP}}$  lockout voltage), write functions to all blocks are disabled. All blocks are locked and the data in the blocks are completely protected.

### 3. Protection of data with F- $\overline{\text{RST}}$

- Especially during power transitions such as power-up and power-down, the flash memory enters reset mode by bringing F- $\overline{\text{RST}}$  to low, which inhibits write operation to all blocks.
- For detailed description on F- $\overline{\text{RST}}$  control, see Chapter 12.6 AC Electrical Characteristics for Flash Memory, Reset Operations.

■ Protection against noises on F- $\overline{\text{WE}}$  signal

To prevent the recognition of false commands as write commands, system designer should consider the method for reducing noises on F- $\overline{\text{WE}}$  signal.

## 17. Design Considerations

### 1. Power Supply Decoupling

To avoid a bad effect to the system by flash memory power switching characteristics, each device should have a 0.1μF ceramic capacitor connected between its F-V<sub>CC</sub> and GND and between its F-V<sub>PP</sub> and GND.

Low inductance capacitors should be placed as close as possible to package leads.

### 2. F-V<sub>PP</sub> Trace on Printed Circuit Boards

Updating the memory contents of flash memories that reside in the target system requires that the printed circuit board designer pay attention to the F-V<sub>PP</sub> Power Supply trace. Use similar trace widths and layout considerations given to the F-V<sub>CC</sub> power bus.

### 3. The Inhibition of Overwrite Operation

Please do not execute reprogramming “0” for the bit which has already been programmed “0”. Overwrite operation may generate unerasable bit.

In case of reprogramming “0” to the data which has been programmed “1”.

- Program “0” for the bit in which you want to change data from “1” to “0”.
- Program “1” for the bit which has already been programmed “0”.

For example, changing data from “1011110110111101” to “1010110110111100” requires “111011111111110” programming.

### 4. Power Supply

Block erase, full chip erase, word write with an invalid F-V<sub>PP</sub> (See Chapter 11. DC Electrical Characteristics) produce spurious results and should not be attempted.

Device operations at invalid F-V<sub>CC</sub> voltage (See Chapter 11. DC Electrical Characteristics) produce spurious results and should not be attempted.

## A-1 RECOMMENDED OPERATING CONDITIONS

### A-1.1 At Device Power-Up

AC timing illustrated in Figure A-1 is recommended for the supply voltages and the control signals at device power-up. If the timing in the figure is ignored, the device may not operate correctly.

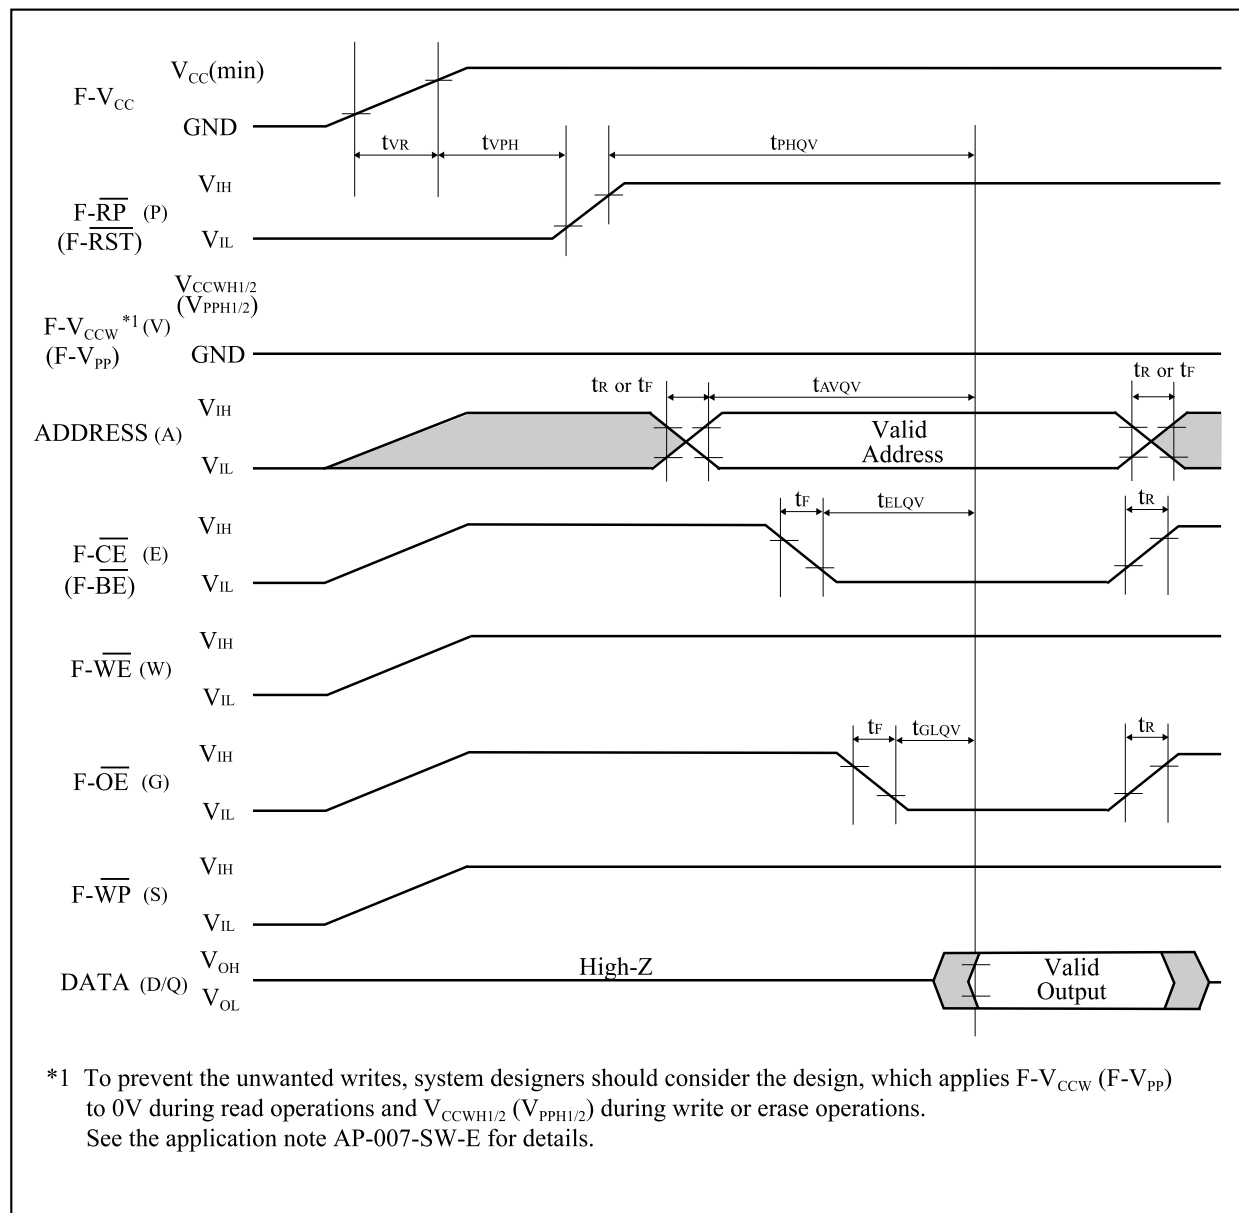

Figure A-1. AC Timing at Device Power-Up

For the AC specifications  $t_{VR}$ ,  $t_R$ ,  $t_F$  in the figure, refer to the next page. See the “AC Electrical Characteristics for Flash Memory” described in specifications for the supply voltage range, the operating temperature and the AC specifications not shown in the next page.

## A-1.1.1 Rise and Fall Time

Symbol	Parameter	Notes	Min.	Max.	Unit
$t_{VR}$	F- $V_{CC}$ Rise Time	1	0.5	30000	$\mu s/V$
$t_R$	Input Signal Rise Time	1, 2		1	$\mu s/V$
$t_F$	Input Signal Fall Time	1, 2		1	$\mu s/V$

## NOTES:

1. Sampled, not 100% tested.
2. This specification is applied for not only the device power-up but also the normal operations.

### A-1.2 Glitch Noises

Do not input the glitch noises which are below  $V_{IH}$  (Min.) or above  $V_{IL}$  (Max.) on address, data, reset, and control signals, as shown in Figure A-2 (b). The acceptable glitch noises are illustrated in Figure A-2 (a).

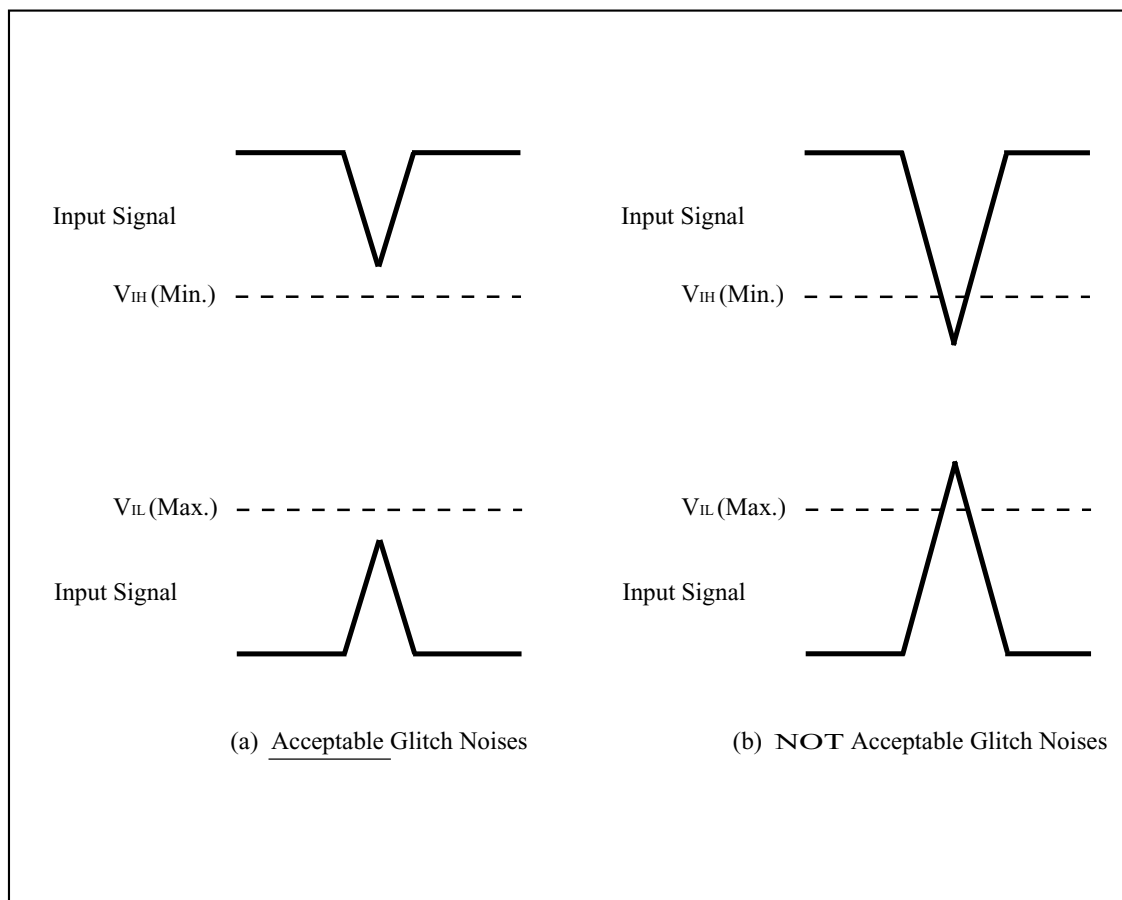

Figure A-2. Waveform for Glitch Noises
