

## TOUCH CONTROL STEP DIMMER LIGHT SWITCH WITH AUTOMATIC GAIN CONTROL (AGC)

September 2000

### FEATURES:

- Touch Sensitivity guaranteed to 600pF Touch Plate Capacitance.
- Touch Operation independent of line plug polarity.
- Pin selection of three available Brightness Step Sequences.
- Minimal external components.
- AGC Loop stabilizes immediately after Power-Up.
- Brightness state is Off after AC power applied.
- Brightness state is unchanged if AC power interrupted for < 0.5 sec.
- Advanced CMOS design for reliable operating characteristics and low power.
- 50/60 Hz Line Frequency.
- +6V to +9.5V Operation ( $V_{DD}-V_{SS}$ ).
- LS7538, LS7539 (DIP) - See Figure 1
- LS7538-S, LS7539-S (SOIC) - See Figure 1

PIN ASSIGNMENT

FIGURE 1

### DESCRIPTION:

The LS7538/LS7539 are monolithic CMOS Silicon Gate integrated circuits which provide trigger pulses for triac phase control of incandescent lamps. The circuits are designed to operate with a wide variety of lamp sizes ranging from small table lamps to large floor lamps. The AGC Loop automatically adjusts Touch Sensitivity to be independent of lamp size.

There are 3 different Brightness Step Sequences for each version of the IC which can be selected by the Three-State MODE pin as shown in Table 1.

TABLE 1. BRIGHTNESS STEP MODES

| MODE PIN                      | BRIGHTNESS STEP SEQUENCE                              |
|-------------------------------|-------------------------------------------------------|
| FLOAT                         | OFF-NIGHT LIGHT-MEDIUM-MAXIMUM-OFF                    |
| $V_{DD}$                      | OFF-NIGHT LIGHT- LOW MEDIUM-HIGH MEDIUM-MAXIMUM-OFF   |
| $V_{SS}$ (LS7538)<br>(LS7539) | OFF-MAXIMUM-MEDIUM-NIGHT LIGHT-OFF<br>OFF-MAXIMUM-OFF |

The lamp brightness is made to vary by changing the delay of the TRIG pulse to the triac from the zero-crossing of the SYNC input. The delays are shown in Table 2 for 50Hz and 60Hz operation along with Delivered Power as a percentage of Full Power. Figure 2 illustrates the delay.

TABLE 2. BRIGHTNESS POWER LEVELS

| Brightness  | 60Hz Delay (1) | 50Hz Delay (2) | % PWR (3) |
|-------------|----------------|----------------|-----------|
| Night Light | 6.0 ms         | 7.2 ms         | 12        |
| Low Medium  | 4.8 ms         | 5.7 ms         | 35        |
| Medium      | 4.0 ms         | 4.8 ms         | 53        |
| High Medium | 3.2 ms         | 3.8 ms         | 72        |
| Maximum     | 0.85 ms        | 1.0 ms         | 99        |

(1) With 300KW connected between Pin 1 and  $V_{DD}$ .

(2) With 360KW connected between Pin 1 and  $V_{DD}$ .

(3) Percentage of Full Power delivered to a resistive load by the Triac Switch.

**FIGURE 2. OUTPUT DELAY (Td)**

**INPUT/OUTPUT DESCRIPTION:**

**CLOCK Input (Pin 1)**

An external resistor connected between this input and  $V_{DD}$ , along with an internal capacitor and oscillator stage, generates a clock which is used for all timing functions. The recommended value of this resistor for 50Hz and 60Hz operation is specified in the ELECTRICAL CHARACTERISTICS. The resistor value determines the Brightness Levels produced. (See Table 2)

**SYNC Input (Pin 2)**

50 or 60Hz AC input for zero crossing detection.

**$V_{DD}$  (Pin 3)**

Supply voltage positive terminal.

**TOUCH Input (Pin 4)**

Input for sensing that a touch has been made on a lamp surface or other touch plate.

**CONTROL I/O (Pin 5)**

An external R-C network connected between this pin and  $V_{DD}$  establishes the controlling feedback for the AGC Loop.

**MODE Input (Pin 6)**

A three-state input used to select the desired Brightness Step Sequence (See Table 1). The MODE Input may be changed during operation.

**$V_{SS}$  (Pin 7)**

Supply voltage negative terminal.

**TRIG (Pin 8)**

The TRIG output produces a negative going pulse every half-cycle of the SYNC input to trigger the triac. The delay,  $T_d$ , of the pulse with respect to the SYNC signal determines the Brightness Level produced. (See Table 2 & Figure 2)

**ABSOLUTE MAXIMUM RATINGS:**

| PARAMETER             | SYMBOL          | VALUE                          | UNIT |
|-----------------------|-----------------|--------------------------------|------|
| DC supply voltage     | $V_{DD}-V_{SS}$ | +11                            | V    |
| Any input voltage     | $V_{IN}$        | $V_{SS}-0.5$ to $V_{DD} + 0.5$ | V    |
| Operating temperature | $T_A$           | -20 to +85                     | °C   |
| Storage temperature   | $T_{STG}$       | -65 to +150                    | °C   |

The information included herein is believed to be accurate and reliable. However, LSI Computer Systems, Inc. assumes no responsibilities for inaccuracies, nor for any infringements of patent rights of others which may result from its use.

**ELECTRICAL CHARACTERISTICS:**

( All voltages referenced to Vss. TA = +25°C unless otherwise specified.)

| PARAMETER                                                            | SYMBOL          | MIN  | TYP | MAX  | UNIT | CONDITIONS                             |

| D1 = 1N4005                                                 |
| T1 = Q4004L4 (Typical Triac)<br>or Q4004F41 (Typical Triac) |

All other values remain the same.

(1) Resistor should be placed adjacent to Pin 1.

**NOTE 1:** Connect MODE (Pin 6) for desired Brightness Step Sequence (See Table 1).

**NOTE 2:** A good PCB layout using through-hole components will provide protection for ESD introduced at the Touch Plate in the range of 25KV. Using surface mount components and/or a poor PCB layout can reduce the ESD protection. The OEM can increase the ESD protection provided by the product with any combination of the following steps:

**Step 1:** The most effective and least costly way to increase ESD protection is to create a spark gap around the Touch Plate input on the PCB. This will increase ESD protection on a good PCB layout to about 35KV. The gap should be made with a split metal ring with each side of the metal ring connected back to opposite sides of the AC line. This ensures that a path for the spark back to house ground through AC Neutral exists independent of line plug polarity. The split ring and the center conduction plate should be constructed so that the spacing between them conforms to UL requirements. The spark gap will absorb most of the ESD leaving a remnant of about 10KV for the rest of the circuit to absorb.

**Step 2:** Increase R3 from 1KW to 5.1KW and add C7, a 0.1μF capacitor, between VDD and VSS.  
(A minimal loss in touch sensitivity may be experienced.)

**Step 3:** Replace diodes D2 and D3 (1N4148) with Schottky diodes (1N5819 or similar)
