

NB100EP223

3.3V 1:22 Differential HSTL/PECL to HSTL Clock Driver with LVTTL Clock Select and Output Enable

The NB100EP223 is a low skew 1-to-22 differential clock driver, designed with clock distribution in mind, accepting two clock sources into an input multiplexer. The part is designed for use in low voltage applications which require a large number of outputs to drive precisely aligned low skew signals to their destination. The two clock inputs are differential HSTL or LVPECL and they are selected by the CLK_SEL pin which is LVTTL. To avoid generation of a runt clock pulse when the device is enabled/disabled, the Output Enable (OE), which is LVTTL, is synchronous ensuring the outputs will only be enabled/disabled when they are already in LOW state (See Figure 7).

The NB100EP223 guarantees low output-to-output skew. The optimal design, layout, and processing minimize skew within a device and from lot to lot. The output structure uses an open emitter architecture and will be terminated with 50 Ω to ground instead of a standard HSTL configuration (See Figure 6).

- 100 ps Typical Device-to- Device Skew
- 25 ps Typical Within Device Skew
- HSTL Compatible Outputs Drive 50 Ω to Ground With No Offset Voltage
- Maximum Frequency >500 MHz
- 1 ns Typical Propagation Delay
- LVPECL and HSTL Mode Operating Range: $V_{CC} = 3\text{ V}$ to 3.6 V with $GND = 0\text{ V}$, $V_{CCO} = 1.6\text{ V}$ to 2.0 V
- Q Output will Default Low with Inputs Open

V_{PP}	Input Swing (Differential Mode) (Note 9) (Figure 4) LVPECL, HSTL	150	800	1200	150	800	1200	150	800	1200	mV
t_S	OE Set Up Time (Note 8)	1.0			1.0			1.0			ns
t_H	OE Hold Time	0.5			0.5			0.5			ns
t_r/t_f	Output Rise/Fall Time (20%-80%)	300	450	700	275	450	700	350	500	750	ps

5. Measured with 750 mV (LVPECL) source or 1 V (HSTL) source, 50% duty cycle clock source. All outputs loaded with 50 Ω to ground (See Figure 6).
6. Skew is measured between outputs under identical transitions and conditions on any one device.
7. Device-to-Device skew for identical transitions at identical V_{CC} levels.
8. OE Set Up Time is defined with respect to the rising edge of the clock. OE High-to-Low transition ensures outputs remain disabled during the next clock cycle. OE Low-to-High transition enables normal operation of the next input clock (See Figure 7).
9. V_{PP} is the differential input voltage swing required to maintain AC characteristics including t_{PD} and device-to-device skew.

APPLICATIONS INFORMATION

Using the thermally enhanced package of the NB100EP223

The NB100EP223 uses a thermally enhanced 64-lead LQFP package. The package is molded so that a portion of the leadframe is exposed at the surface of the package bottom side. This exposed metal pad will provide the low thermal impedance that supports the power consumption of the NB100EP223 high-speed bipolar integrated circuit and will ease the power management task for the system design. In multilayer board designs, a thermal land pattern on the printed circuit board and thermal vias are recommended to maximize both the removal of heat from the package and electrical performance of the NB100EP223. The size of the land pattern can be larger, smaller, or even take on a different shape than the exposed pad on the package. However, the solderable area should be at least the same size and shape as the exposed pad on the package. Direct soldering of the exposed pad to the thermal land will provide an efficient thermal conduit. The thermal vias will connect the exposed pad of the package to internal copper planes of the board. The number of vias, spacing, via diameters and land pattern design depend on the application and the amount of heat to be removed from the package.

Maximum thermal and electrical performance is achieved when an array of vias is incorporated in the land pattern.

The recommended thermal land design for NB100EP223 applications on multi-layer boards comprises a 4 X 4 thermal via array using a 1.2 mm pitch as shown in Figure 8 providing an efficient heat removal path.

Figure 8. Recommended Thermal Land Pattern

The via diameter should be approximately 0.3 mm with 1 oz. copper via barrel plating. Solder wicking inside the via may result in voiding during the solder process and must be avoided. If the copper plating does not plug the vias, stencil print solder paste onto the printed circuit pad. This will

supply enough solder paste to fill those vias and not starve the solder joints. The attachment process for the exposed pad package is equivalent to standard surface mount packages. Figure 9, "Recommended solder mask openings", shows a recommended solder mask opening with respect to a 4 X 4 thermal via array. Because a large solder mask opening may result in a poor rework release, the opening should be subdivided as shown in Figure 9. For the nominal package standoff of 0.1 mm, a stencil thickness of 5 to 8 mils should be considered.

Figure 9. Recommended Solder Mask Openings

Proper thermal management is critical for reliable system operation. This is especially true for high-fanout and high output drive capability products.

For thermal system analysis and junction temperature calculation the thermal resistance parameters of the package is provided:

Table 1. Thermal Resistance *

LFPM	θ_{JA} °C/W	θ_{JC} °C/W
0	35.6	3.2
100	32.8	4.9
500	30.0	6.4

* Junction to ambient and Junction to board, four-conductor layer test board (2S2P) per JESD 51-8

These recommendations are to be used as a guideline, only. It is therefore recommended that users employ sufficient thermal modeling analysis to assist in applying the general recommendations to their particular application to assure adequate thermal performance. The exposed pad of the NB100EP223 package is electrically shorted to the substrate of the integrated circuit and GND. The thermal land should be electrically connected to GND.
