# **PCA9538**

8-bit I<sup>2</sup>C and SMBus low power I/O port with interrupt and reset

Objective data sheet

# 8-bit I<sup>2</sup>C and SMBus low power I/O port with interrupt and reset

**PCA9538** 

### **FEATURES**

- 8-bit I2C GPIO with interrupt and reset
- Operating power supply voltage range of 2.3 to 5.5 V
- 5 V tolerant I/Os
- Polarity inversion register
- Active LOW interrupt output
- Active LOW reset input
- Low stand-by current
- Noise filter on SCL/SDA inputs
- No glitch on power-up
- Internal power-on reset
- 8 I/O pins which default to 8 inputs
- 0 to 400 kHz clock frequency
- ESD protection exceeds 2000 V HBM per JESD22-A114, 200 V MM per JESD22-A115 and 1000 V CDM per JESD22-C101
- Latch-up testing is done to JESDEC Standard JESD78 which exceeds 100 mA
- Offered in three different packages: SO16, TSSOP16, and HVQFN16

#### DESCRIPTION

The PCA9538 is a16-pin CMOS device that provide 8 bits of General Purpose parallel Input/Output (GPIO) expansion with interrupt and reset for I<sup>2</sup>C/SMBus applications and was developed to enhance the Philips family of I<sup>2</sup>C I/O expanders. I/O expanders provides a simple solution when additional I/O is needed for ACPI power switches, sensors, pushbuttons, LEDs, fans, etc.

The PCA9538 consists of an 8-bit Configuration register (Input or Output selection); 8-bit Input register, 8-bit Output register and an 8-bit Polarity inversion register (Active HIGH or Active LOW operation). The system master can enable the I/Os as either inputs or outputs by writing to the I/O configuration bits. The data for each Input or Output is kept in the corresponding Input or Output register. The polarity of the input port register can be inverted with the Polarity Inversion Register. All registers can be read by the system master

The PCA9538 is identical to the PCA9554 except for the removal of the internal I/O pull-up resistor which greatly reduces power consumption when the I/Os are held LOW, replacement of A2 with RESET and different address range.

The PCA9538 open-drain interrupt output is activated when any input state differs from its corresponding input port register state and is used to indicate to the system master that an input state has changed. The power-on reset sets the registers to their default values and initializes the device state machine. The RESET pin causes the same reset/initialization to occur without depowering the device.

Two hardware pins (A0 and A1) vary the fixed  $I^2C$  address and allow up to four devices to share the same  $I^2C/SMBus$ .

### ORDERING INFORMATION

PACKAGES	TEMPERATURE RANGE	ORDER CODE	TOPSIDE MARK	DRAWING NUMBER
16-Pin Plastic SO (wide)	–40 °C to +85 °C	PCA9538D	PCA9538D	SOT162-1
16-Pin Plastic TSSOP	–40 °C to +85 °C	PCA9538PW	PCA9538	SOT403-1
16-Pin Plastic HVQFN	–40 °C to +85 °C	PCA9538BS	9538	SOT629-1

Standard packing quantities and other packing data are available at www.philipslogic.com/packaging.

SMBus as specified by the Smart Battery System Implementers Forum is a derivative of the Philips I<sup>2</sup>C patent.

I<sup>2</sup>C-bus is a trademark of Philips Semiconductors Corporation.

PCA9538

#### **REGISTERS**

## **Command Byte**

Command	Protocol	Function
0	Read byte	Input port register
1	Read/write byte	Output port register
2	Read/write byte	Polarity inversion register
3	Read/write byte	Configuration register

The command byte is the first byte to follow the address byte during a write transmission. It is used as a pointer to determine which of the following registers will be written or read.

## Register 0 - Input Port Register

bit	17	16	15	14	13	12	I1	10
default	1	1	1	1	1	1	1	1

This register is a read only port. It reflects the incoming logic levels of the pins, regardless of whether the pin is defined as an input or an output by Register 3. Writes to this register have no effect.

### Register 1 – Output Port Register

bi	t	07	O6	O5	04	О3	O2	01	O0
defa	ult	1	1	1	1	1	1	1	1

This register reflects the outgoing logic levels of the pins defined as outputs by Register 3. Bit values in this register have no effect on pins defined as inputs. Reads from this register return the value that is in the flip-flop controlling the output selection, NOT the actual pin value.

### Register 2 – Polarity Inversion Register

bit	N7	N6	N5	N4	N4 N3 N2 I			N0
default	0	0	0	0	0	0	0	0

This register allows the user to invert the polarity of the Input Port Register data. If a bit in this register is set (written with '1'), the corresponding Input Port data is inverted. If a bit in this register is cleared (written with a '0'), the Input Port data polarity is retained.

### Register 3 - Configuration Register

bit	C7	C6	C5	C4	C3	C2	C1	C0
default	1	1	1	1	1	1	1	1

This register configures the directions of the I/O pins. If a bit in this register is set, the corresponding port pin is enabled as an input with high-impedance output driver. If a bit in this register is cleared, the corresponding port pin is enabled as an output. At reset, the I/Os are configured as inputs.

#### **Power-on Reset**

When power is applied to  $V_{DD}$ , an internal power-on reset holds the PCA9538 in a reset condition until  $V_{DD}$  has reached  $V_{POR}$ . At that point, the reset condition is released and the PCA9538 registers and state machine will initialize to their default states. Thereafter,  $V_{DD}$  must be lowered below 0.2 V to reset the device.

For a power reset cycle,  $V_{DD}$  must be lowered below 0.2 V and then restored to the operating voltage.

### **RESET** Input

A reset can be accomplished by holding the  $\overline{\text{RESET}}$  pin LOW for a minimum of  $t_W$ . The PCA9538 registers and SMBus/I²C state machine will be held in their default state until the  $\overline{\text{RESET}}$  input is once again HIGH. This input typically requires a pull-up to  $V_{DD}$ .

### **Interrupt Output**

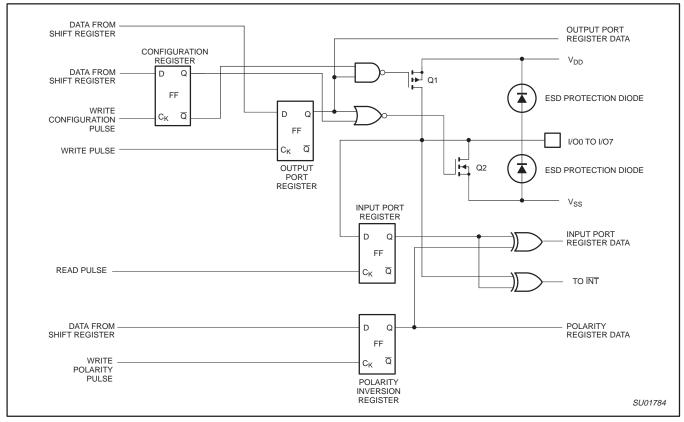

The open-drain interrupt output is activated when one of the port pins change state and the pin is configured as an input. The interrupt is deactivated when the input returns to its previous state or the input port register is read.

Note that changing an I/O from an output to an input may cause a false interrupt to occur if the state of the pin does not match the contents of the input port register.

# 8-bit I<sup>2</sup>C and SMBus low power I/O port with interrupt and reset

PCA9538

### SIMPLIFIED SCHEMATIC OF I/O0 TO I/O7

NOTE: At Power-on Reset, all registers return to default values.

Figure 4. Simplified schematic of I/O0 to I/O7

## I/O port

When an I/O is configured as an input, FETs Q1 and Q2 are off, creating a high-impedance input. The input voltage may be raised above  $V_{DD}$  to a maximum of 5.5 V.

If the I/O is configured as an output, then either Q1 or Q2 is enabled, depending on the state of the output port register. Care should be exercised if an external voltage is applied to an I/O configured as an output because of the low impedance paths that exist between the pin and either  $\rm V_{DD}$  or  $\rm V_{SS}$ .

# 8-bit I<sup>2</sup>C and SMBus low power I/O port with interrupt and reset

PCA9538

### **Device address**

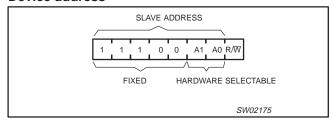

Figure 5. PCA9538 address

### **Bus transactions**

Data is transmitted to the PCA9538 registers using the write mode as shown in Figures 6 and 7. Data is read from the PCA9538 registers using the read mode as shown in Figures 8 and 9. These devices do not implement an auto-increment function so once a command byte has been sent, the register which was addressed will continue to be accessed by reads until a new command byte has been sent.

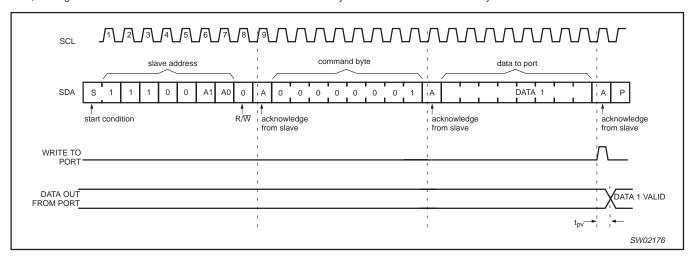

Figure 6. WRITE to output port register

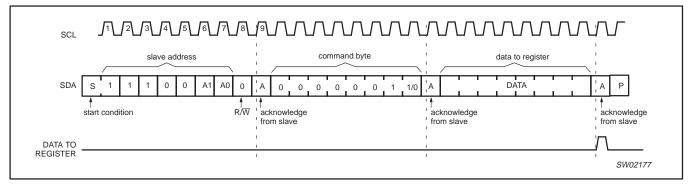

Figure 7. WRITE to configuration or polarity inversion registers

# 8-bit I<sup>2</sup>C and SMBus low power I/O port with interrupt and reset

PCA9538

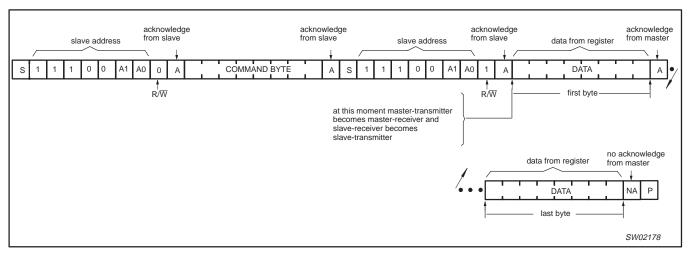

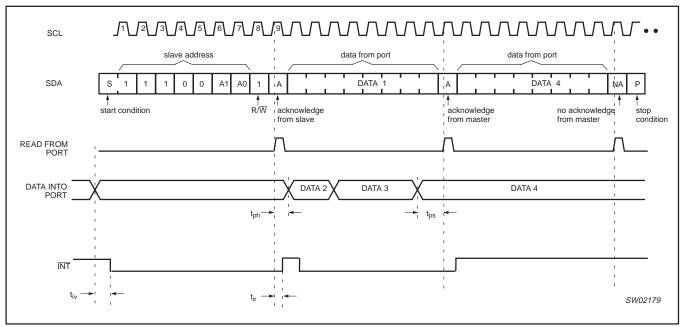

Figure 8. READ from register

#### NOTES:

- 1. This figure assumes the command byte has previously been programmed with 00h.
- 2. Transfer of data can be stopped at any moment by a stop condition.

Figure 9. READ input port register

PCA9538

### TYPICAL APPLICATION

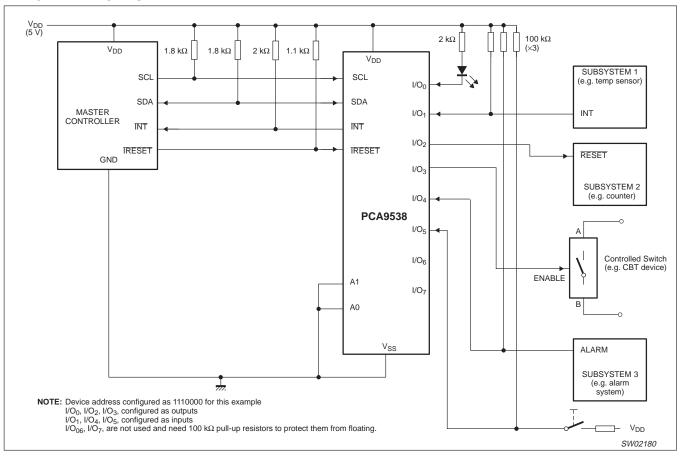

Figure 10. Typical application

# Minimizing I<sub>DD</sub> when the I/O is used to control LEDs

When the I/Os are used to control LEDs, they are normally connected to  $V_{DD}$  through a resistor as shown in Figure 10. Since the LED acts as a diode, when the LED is off the I/O  $V_{IN}$  is about 1.2 V less than  $V_{DD}$ . The supply current ,  $I_{DD}$ , increases as  $V_{IN}$  becomes lower than  $V_{DD}$  and is specified as  $\Delta I_{DD}$  in the DC characteristics table.

Designs needing to minimize current consumption, such as battery power applications, should consider maintaining the I/O pins greater than or equal to  $V_{DD}$  when the LED is off. Figure 11 shows a high value resistor in parallel with the LED. Figure 12 shows  $V_{DD}$  less than the LED supply voltage by at least 1.2 V. Both of these methods maintain the I/O  $V_{IN}$  at or above  $V_{DD}$  and prevents additional supply current consumption when the LED is off.

### **HANDLING**

Inputs and outputs are protected against electrostatic discharge in normal handling. However, to be totally safe, it is desirable to take precautions appropriate to handling MOS devices. Advice can be found in Data Handbook IC24 under "Handling MOS devices".

### **DC CHARACTERISTICS**

 $V_{DD}$  = 2.3 to 5.5 V;  $V_{SS}$  = 0 V;  $T_{amb}$  = -40 to +85 °C; unless otherwise specified.

SYMBOL	PARAMETER	CONDITIONS	MIN	TYP	MAX	UNIT

Purchase of Philips I<sup>2</sup>C components conveys a license under the Philips' I<sup>2</sup>C patent to use the components in the I<sup>2</sup>C system provided the system conforms to the I<sup>2</sup>C specifications defined by Philips. This specification can be ordered using the code 9398 393 40011.

#### Data sheet status

Level	Data sheet status <sup>[1]</sup>	Product status <sup>[2] [3]</sup>	Definitions
I	Objective data	Development	This data sheet contains data from the objective specification for product development.  Philips Semiconductors reserves the right to change the specification in any manner without notice.
II	Preliminary data	Qualification	This data sheet contains data from the preliminary specification. Supplementary data will be published at a later date. Philips Semiconductors reserves the right to change the specification without notice, in order to improve the design and supply the best possible product.
III	Product data	Production	This data sheet contains data from the product specification. Philips Semiconductors reserves the right to make changes at any time in order to improve the design, manufacturing and supply. Relevant changes will be communicated via a Customer Product/Process Change Notification (CPCN).

- [1] Please consult the most recently issued data sheet before initiating or completing a design.
- [2] The product status of the device(s) described in this data sheet may have changed since this data sheet was published. The latest information is available on the Internet at URL http://www.semiconductors.philips.com.
- [3] For data sheets describing multiple type numbers, the highest-level product status determines the data sheet status.

### **Definitions**

Short-form specification — The data in a short-form specification is extracted from a full data sheet with the same type number and title. For detailed information see the relevant data sheet or data handbook.

Limiting values definition — Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 60134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.

Application information — Applications that are described herein for any of these products are for illustrative purposes only. Philips Semiconductors make no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

#### **Disclaimers**

Life support — These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips Semiconductors customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips Semiconductors for any damages resulting from such application.

Right to make changes — Philips Semiconductors reserves the right to make changes in the products—including circuits, standard cells, and/or software—described or contained herein in order to improve design and/or performance. When the product is in full production (status 'Production'), relevant changes will be communicated via a Customer Product/Process Change Notification (CPCN). Philips Semiconductors assumes no responsibility or liability for the use of any of these products, conveys no license or title under any patent, copyright, or mask work right to these products, and makes no representations or warranties that these products are free from patent, copyright, or mask work right infringement, unless otherwise specified.
