

2.5 Gbits/s Transponder with 16-Channel 155Mbps/s Multiplexer/ Demultiplexer with Clock Recovery

Features

- ☑ Full Compliance with OC-48/STM-16 SONET/SDH Specifications
- ☑ Long Reach, Intermediate Reach & Short Reach
- ☑ Eye Safe (Class I Laser Safety)
- ☑ Laser bias monitor analog output
- ☑ Module Fail Alarm output
- ☑ Pigtailed Optical Interface
- ☑ -40°C to +85°C Operating Temperature ("A" Option)
- ☑ Single + 3.3 V supply

Description

The PTC-48 fiber optic transponder offers a simple, convenient way to interface to single mode fiber optic cables for short reach, intermediate reach, and long reach applications. The transponders are designed to meet or exceed the SONET/SDH optical interface requirements at OC-48/STM-16 (2488 Mb/s) data rate. Many versions are available with 1300nm Fabry Perot laser for SR, 1310nm DFB for IR1 and LR1, a 1550nm DFB lasers are used for IR2 and LR2 applications. The modules are fully compliant to all applicable SONET/SDH specifications. All modules satisfy Class I Laser Safety requirements in accordance with the US FDA/CDRH and international IEC-825 standards.

On the transmitter side, the PTC-48 multiplexes sixteen 155 Mbps/s parallel data and transmits serialized optical signal at 2488Mbps/s to the fiber. On the receiver side, the module receives a 2488Mbps/s optical signal, which is converted to an electrical signal. The module regenerates the clock signal and demultiplexes the serialized data into

sixteen 155 Mbps/s differential LVPECL data signals.

The transmit and receive functions are contained in a two-row, 160-pin (2x80) package with pigtail, which is terminated with SC, ST or FC Optical connector. The transmitter incorporates all the necessary control and driver circuitry for converting parallel differential data signals to serial light. A Transmitter Disable input and Laser Bias Monitor output is provided. The receiver uses a PIN photodiode for SR & IR and an APD for LR to convert the serial light signal into an parallel differential electrical output signal. This transponder offers a unique function which monitors the internal circuitry to detect "silent" failures. A Signal Detect function which indicates loss of optical input is also provided.

The PTC-48 transceiver operates from a single +3.3V power supply over an operating temperature range of 0°C to +70°C ("B" Option) or -40°C to +85°C ("A" Option). The transceiver package is made of metal for good EMI shielding.

Absolute Maximum Ratings

Parameter		Symbol	Minimum	Maximum	Units
Storage Temperature		T_{st}	- 40	+ 85	°C
Operating Case Temperature	"A" Option	T_{op}	- 40	+ 85	°C
	"B" Option		0	+ 70	
Operating Ambient Temperature ¹			0	+ 65	
Supply Voltage		V_{CC}	0	+ 6.0	V

¹With minimum of 150 linear foot per minute airflow.

PTC-48

Transmitter Optical Characteristics (over Operating Case Temperature Range)

Parameter		Symbol	Minimum	Typical	Maximum	Units
Serial Optical Output Data Rate		B_O	-	2.488	-	Gb/s
Average Optical Output Power (50% duty cycle)	L1	P_o	- 10.0	- 7.0	- 3.0	dBm
	L0		- 5.0	- 3.0	0	
	HP		- 2.0	0	3.0

Laser Safety: All transmitters are Class I Laser products per FDA/CDRH and IEC-825 standards. They must be operated under specified operating conditions.

Optical Communication Products, Inc.

DATE OF MANUFACTURE:

MANUFACTURED IN THE USA

This product complies with
21 CFR 1040.10 and 1040.11

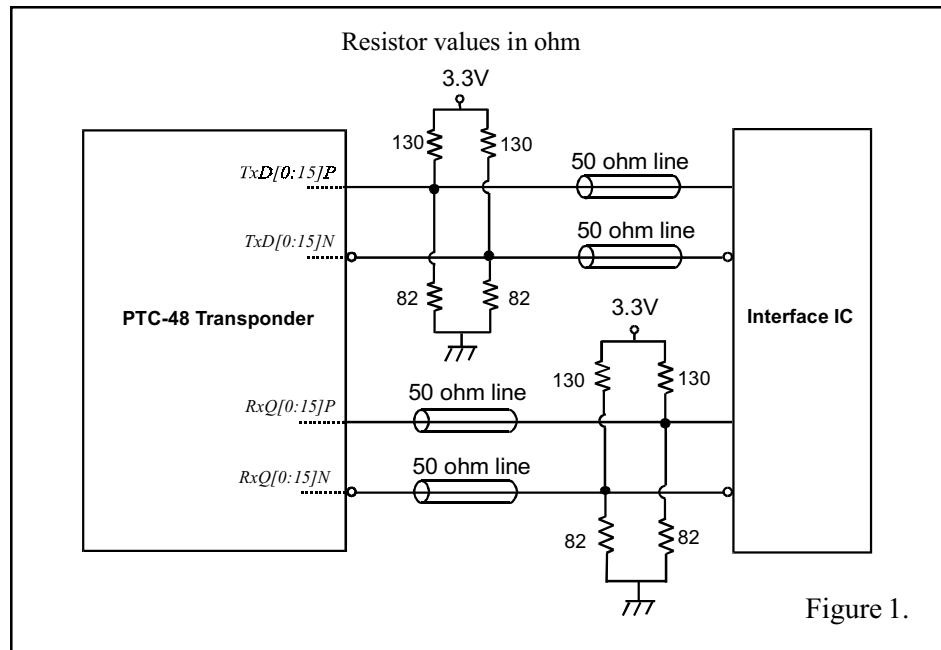

Meets Class I Laser Safety Requirements

PTC-48

Application notes:

TxD[0:15]P and TxD[0:15]N: Transmitter interfaces to 16-bit differential parallel input data lines. TxD00P/N is the least significant bit of input word and is the last bit serialized. The input signal is LVPECL and it could be terminated as shown in Fig. 1.

RxD[0:15]P and RxD[0:15]N: Receiver interfaces to 16-bit differential parallel output data lines. RxD00P/N is the least significant bit of receiver word and is the last bit serialized. The output signal is LVPECL and it could be terminated as shown in Fig. 1.

MODFAILB: The output of the Module Fail B is normally High. A “LOW” indicates the module self check failed. This function monitors 80% of the internal circuitry to detect “silent” failures.

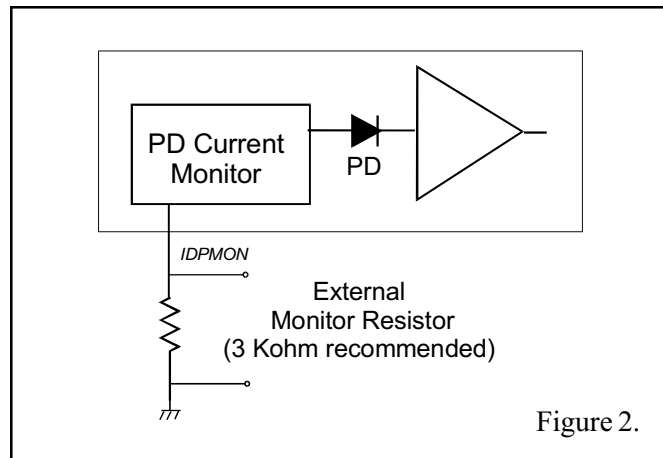

IDPMON: This output will allow the user to measure the photocurrent generated by the optical receiver’s photodiode. The current output has a gain of 8 for Pin version and gain of 1 for APD version. The recommended circuit is shown in Fig. 2.

LOCKDET: Lock Detect output is a LVTTTL signal. If this output is logic “LOW” it indicates POCLK is equal to clocked signal provided at the TxREFCLK. LOCKDET does not require any termination.

DLOOP: Diagnostic Loopback Enable. The input is LVTTTL. When the input is logic “LOW”, 2.5 Gb/s serial data stream from the parallel-to-serial converter is looped back internally to the serial-to-parallel converter along with an internally generated bit synchronous serial clock. The receiver serial data path from the optical receiver is disabled temporally.

LLOOP: Line Loopback Enable is a LVTTTL input signal. When LLOOP is logic “LOW”, the 2.5 Gb/s serial data and Recovered clock from the optical receiver are looped directly back to the optical transmitter. The multiplexed serial data from the parallel-to-serial converter is ignored.

OOF: Out of Frame is LVTTTL input signal. This input generally generated by a circuit that monitors the state of the frame boundaries of the received SONET/SDH signal.

TxREFCLKP/N: Differential LVPECL low jitter 155.52 MHz Input Reference Clock. This input is used as the reference for the internal clock frequency synthesizer which generates the 2.5 GHz bit rate clock used to shift data out of the parallel-to-serial converter and also for the byte-rate clock, which transfers the 16-bit parallel input data from the input holding register into the parallel-to-serial shift register.

RESET: Master Reset function is used to reset the multiplexer/demultiplexer. A logic “LOW” at the input clears all registers and buffers. While resetting, the multiplexer/demultiplexer, POCLK and PCLK does not toggle.

TxDIS: Transmitter disable input. Logic “HIGH” at the input will deactivate the laser so there is no optical output.

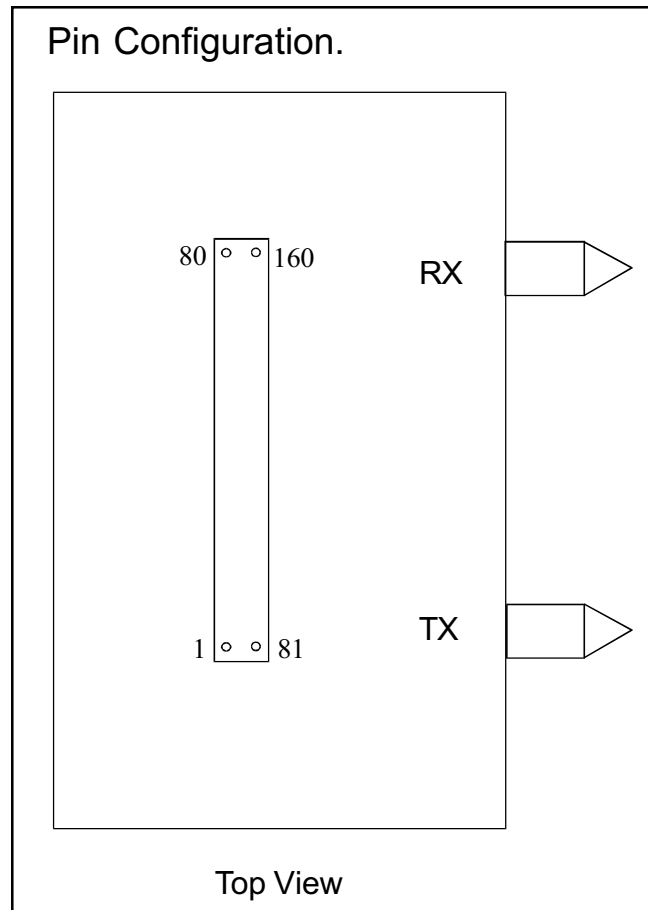

Application notes (continued)

PCLKP and PCLKN: Parallel Byte Clock is a differential LVPECL signal. A byte-rate reference clock generated by dividing the internal 2.488GHz serial bit clock by 16. This output is normally used to synchronize byte-wide transfers from upstream logic into the PTC-48 transponder.

PHERR: Phase Error Signal is a Single-Ended LVPECL signal. This signal pulses high during each PCLK cycle for which there is potential setup/hold timing violations between the internal byte clock and the PICLK timing domains. PHERR is updated on the falling edge of the PICLK output.

FP: Frame Pulse is LVPECL output signal. It indicates the frame boundaries in the received serial data stream. If framing pattern detection is enabled, FP pulses high for one POCLK cycle when a 32-bit sequence matching the framing pattern is detected in the received serial data.

POCLKP and POCLKN: Differential LVPECL Parallel Output Clock. A 155MHz normally 50% duty cycle, Byte rate output clock that is aligned to the RxQ[0:15] byte serial output data. Rx[0:15] and FP are updated on the falling edge of POCLK.

SEARCH: A1 A2 Frame Search Output is a LVTTTL signal. When the output of this pin is logic “HIGH” it indicates that the frame detection circuit is active and is searching for a new A1 A2 byte alignment. The output will remain high during the A1 A2 frame search.

LOS: Loss of Signal is output and indicates the a loss of signal when insufficient optical power is received.

LSRBIAS: Laser Bias Monitor indicates the health of the laser in the transmitter. If this output voltage reaches 1.4V (70mA of bias current), the automatic power control circuit is struggling to maintain output power. This may indicate that the laser has reached an end-of-life condition.

LSRALRM: Laser Degrade Alarm logic “LOW” output will indicate that the transmitters automatic power control circuits are unable to maintain the nominal output power. This output will become active “LOW” when the optical output power degrades 3 dB below the nominal operating power.

LPM: Laser Power Monitor output is a analog output which indicate the level of the transmitting power from the transmitter. This output is set a 500mV for the nominal transmitter optical output power.

OOF: Out of Frame is LVTTTL input signal. This input generally generated by circuit that monitors the state of the frame boundaries of the received SONET/SDH signal are unknown, after the system reset or loss of synchronization.

PICLK and PICLKN: Differential LVPECL Parallel input Clock. A 155MHz normally 50% duty cycle input clock to which TxD[0:15]P and TxD[0:15]N are assigned. The rising edge of PICLK transfers the data on the 16 TxD inputs into the holding register of the parallel-to-serial converter.

Package Outline

Ordering Information

PTC - 48 - Pzz - T - yy - DRn

Package style	Temperature Range	Light Output Power	Distance Option
PSC : Pigtailed with SC	A: -40°C to +85°C	L1: -7 dBm (typ.)	SR : Short Reach ("L1" only), (2km ¹)
PST : Pigtailed with ST	(Consult OCP)	L0: -3 dBm (typ.)	IR1 : Intermediate Reach ("L0" only), 15km ¹
PFC : Pigtailed with FC	B: 0°C to +70°C	HP: 0 dBm (typ.)	IR2 : Intermediate Reach ("L0" only), 15km ¹
			LR1: Long Reach, (40km ¹)
			LR2: Extended Long Reach, (80km ¹)

¹These are target distances to be used for classifications and not for specification, per ITU-T Recommendations G.957.
