Functional Description

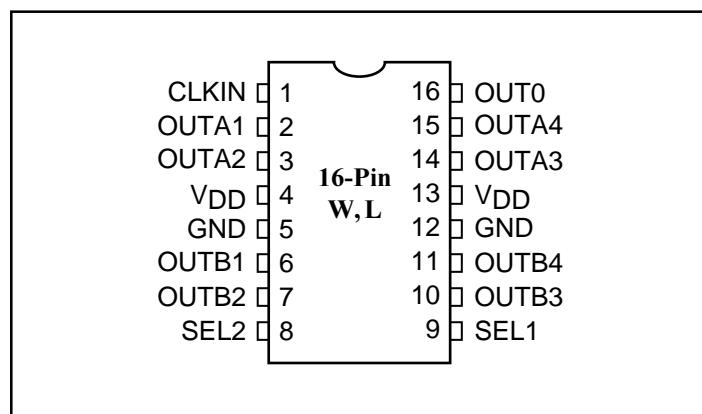

The PI6C230x is a PLL based, zero-delay buffer, with the ability to distribute five outputs on PI6C2305, nine outputs on PI6C2309 of up to 133MHz at 3.3V. All the outputs are distributed from a single clock input CLKIN and output CLK0 performs zero delay by connecting a feedback to PLL.

PI6C2309 has two banks of four outputs that can be controlled by the selection inputs, SEL1 & SEL2. It also has a powersparing feature: when input SEL1 is 0 and SEL2 is 1, PLL is turned off and all outputs are referenced from CLKIN. PI6C2305 is an 8-pin version of PI6C2309 without selection inputs. PI6C230X is available in high drive and industrial environment versions.

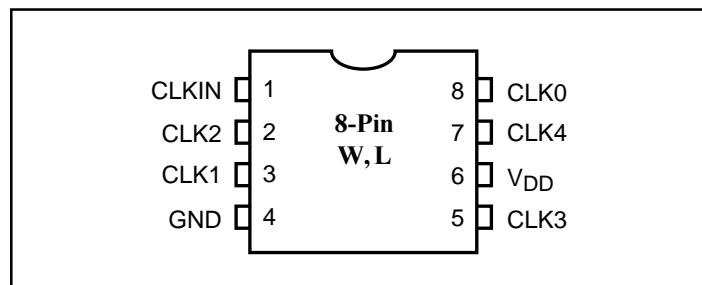

An internal feedback on OUT0 is used to synchronize the outputs to the input; the relationship between loading of this signal and the outputs determines the input-output delay. PI6C230X are characterized for both commercial and industrial operation

Zero Delay and Skew Control

CLKIN Input to OUTA/OUTB Delay vs. Difference in Loading between OUT0 pin and OUTA/OUTB pins

The relationship between loading of the FB_IN signal and other outputs determines the input-output delay. Zero delay is achieved when all outputs, including feedback, are loaded equally.
