Product Description

Pericom Semiconductor's PI3B series of Bus Switch circuits are produced in the Company's advanced 0.35 micron CMOS technology, achieving industry leading speed.

The PI3B16861 is configured as a 3.3 volt, hot insertion, 20-bit, 2-port bus switch designed with a low ON resistance (5Ω) allowing inputs to be connected directly to outputs. The bus switch creates no additional propagational delay or additional ground bounce noise. The switch is turned ON by the Bus Enable ($\overline{BE}x$) input signal.

The PI3B162861 device has a built-in 25-ohm series resistor to reduce noise resulting from reflections, thus eliminating the need for an external terminating resistor.

Capacitance (T_A = 25°C, f = 1 MHz)

Parameters[4]	Description	Test Conditions	Typ	Units
C_{IN}	Input Capacitance	V_{IN} = 0V	3.0	pF
C_{OFF}	A/B Capacitance, Switch Off	V_{IN} = 0V	8.5	pF
C_{ON}	A/B Capacitance, Switch On	V_{IN} = 0V	17.0	pF

Notes:
1. For Max. or Min. conditions, use appropriate value specified under Electrical Characteristics for the applicable device type.
2. Typical values are at Vcc = 3.3V, T_A = 25°C ambient and maximum loading.
3. Measured by the voltage drop between A and B pin at indicated current through the switch. ON resistance is determined by the lower of the voltages on the two (A,B) pins.
4. This parameter is determined by device characterization but is not production tested.

Switching Characteristics over Operating Range

Parameters	Description	Conditions[1]		PI3B16861/PI3B162861 Com. Min.	Com. Max.	Units
t_{PLH}	Propagation Delay[2,3]	C_L = 50pF	16861	—	0.25	ns
t_{PHL}	Ax to Bx, Bx to Ax	R_L = 500Ω	162861	—	1.25	
t_{PZH}	Bus Enable Time	C_L = 50pF,		1	4.5	
t_{PZL}	BE to Ax or Bx	R_L = 500Ω,				
t_{PHZ}	Bus Disable Time	R = 500Ω		1	5	
t_{PLZ}	BE to Ax or Bx					

Notes:
1. See test circuit and waveforms.
2. This parameter is guaranteed but not tested on Propagation Delays.
3. The bus switch contributes no propagational delay other than the RC delay of the ON resistance of the switch and the load capacitance. The time constant for the switch alone is of the order of 0.25ns for 50pF load. Since this time constant is much smaller than the rise/fall times of typical driving signals, it adds very little propagational delay to the system. Propagational delay of the bus switch when used in a system is determined by the driving circuit on the driving side of the switch and its interaction with the load on the driven side.

Power Supply Characteristics

Parameters	Description	Test Conditions[1]		Min.	Typ[2]	Max.	Units
I_{CC}	Quiescent Power Supply Current	V_{CC} = Max.	V_{IN} = GND or V_{CC}			10	µA
ΔI_{CC}	Supply Current per Input @ TTL HIGH	V_{CC} = Max.	V_{IN} = 3.0V[3]			750	µA
I_{CCD}	Supply Current per Input per MHz[4]	V_{CC} = Max. A and B Pins Open $\overline{BE}$ = GND Control Input Toggling 50% Duty Cycle				0.25	mA/ MHz

Notes:
1. For Max. or Min. conditions, use appropriate value specified under Electrical Characteristics for the applicable device.
2. Typical values are at Vcc = 3.3V, +25°C ambient.
3. Per TTL driven input (control inputs only); A and B pins do not contribute to Icc.
4. This current applies to the control inputs only and represent the current required to switch internal capacitance at the specified frequency. The A and B inputs generate no significant AC or DC currents as they transition. This parameter is not tested, but is guaranteed by design.
