

**2.5V 10-Bit Flip-Flop with Dual and 3-State Outputs**

### Product Features

- PI74AVC+16820 is designed for low voltage operation,  $V_{CC} = 1.65V$  to  $3.6V$
- True  $\pm 24mA$  Balanced Drive @  $3.3V$
- $I_{OFF}$  supports partial power-down operation
- $3.6V$  I/O Tolerant inputs and outputs
- All outputs contain noise reduction circuitry reducing noise without speed degradation
- Industrial operation at  $-40^{\circ}C$  to  $+85^{\circ}C$
- Available Packages:
  - 56-pin 240-mil wide plastic TSSOP
  - 56-pin 173-mil wide plastic TSVOP

### Product Description

Pericom Semiconductor's PI74AVC+ series of logic circuits are produced using the Company's advanced submicron CMOS technology, achieving industry leading speed.

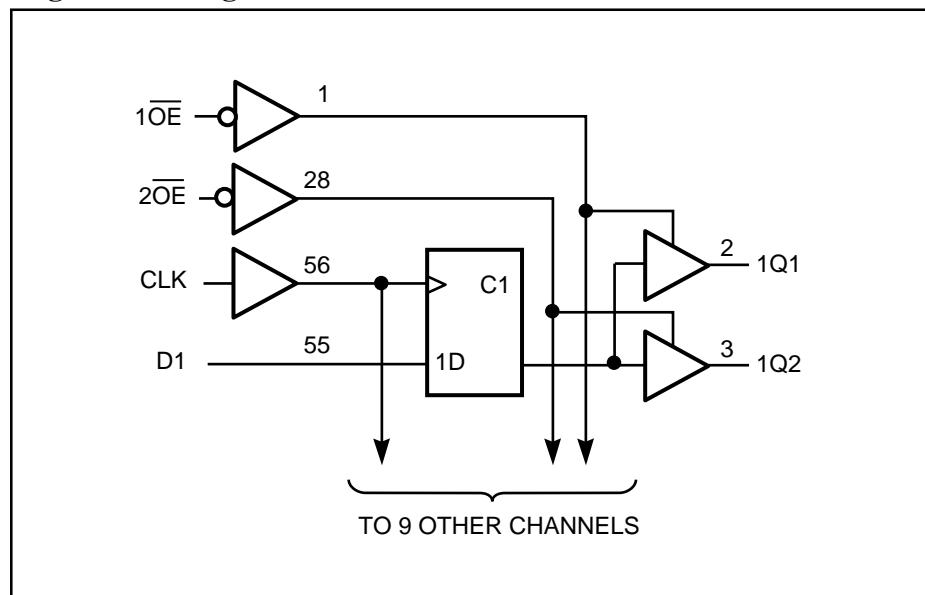

The PI74AVC+16820, a 10-bit flip-flop designed for  $1.65V$  to  $3.6V$   $V_{CC}$  operation, is designed with edge-triggered D-type flip-flops. On the positive transition of clock (CLK) input, the device provides true data at the Q outputs.

A buffered output-enable ( $\overline{OE}$ ) input can be used to place the ten outputs in either a normal logic state (HIGH or LOW level) or a high-impedance state. In the high-impedance state, the outputs neither load nor drive the bus lines significantly. The high-impedance state and increased drive provide the capacity to drive bus lines without the need for interface or pullup components.

$\overline{OE}$  does not affect the internal operation of the flip-flops. Old data can be retained or new data can be entered while the outputs are in the high-impedance state.

To ensure the high-impedance state during power up or power down,  $\overline{OE}$  should be tied to  $V_{CC}$  through a pullup resistor whose minimum value is determined by the current sinking capability of the driver.

**Maximum Ratings** (Above which the useful life may be impaired. For user guidelines, not tested.)

#### Notes:

1. Input & output negative-voltage ratings may be exceeded if the input and output current rating are observed.
  2. Output positive-voltage rating may be exceeded up to 4.6V maximum if the output current rating is observed.
  3. The package thermal impedance is calculated in accordance with JESD51.

Stresses greater than those listed under MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
