PCA9550 2-bit I²C LED driver with programmable blink rates

Objective data 2002 Feb 11

File under Integrated Circuits ICL03

2-bit I²C LED driver with programmable blink rates

PCA9550

FEATURES

- 2 LED drivers (on, off, flashing at a programmable rate)
- 2 selectable, fully programmable blink rates (frequency and duty cycle) between 40 Hz and 6.4 seconds
- Internal oscillator requires no external components
- I²C interface logic compatible with SMBus
- Internal power-on reset
- Noise filter on SCL/SDA inputs
- Active low reset input
- 2 open drain outputs directly drive LEDs
- Edge rate control on outputs
- No glitch on power-up
- Supports hot insertion
- Low stand-by current
- Operating power supply voltage range of 2.3 V to 5.5 V
- 0 to 400 kHz clock frequency
- ESD protection exceeds 2000 V HBM per JESD22-A114, 200 V MM per JESD22-A115 and 1000 V CDM per JESD22-C101
- Latch-up testing is done to JESDEC Standard JESD78 which exceeds 100 mA
- Package offer: SO8, TSSOP8

DESCRIPTION

The PCA9550 is an I²C and SMBus I/O expander optimized for blinking LEDs. An internal oscillator and two user programmable blink rates (from 25 msec to 6.4 sec) and duty cycles (from 0% to 99.6%) allow blinking of two LEDs without overloading the bus or tying up the I²C Master timer. The PCA9550, silicon CMOS circuit with open drain outputs directly drives the LEDs with each LED on, off or flashing at one of the two programmable blink rates. Bits not used to drive LEDs can be used as normal GPIO inputs or outputs. Maximum output sink current is 25 mA per bit and 50 mA per package.

The active low hardware reset pin (RESET) and Power On Reset (POR) initializes the registers to their default state, all zeroes, causing the bits to be set high (LED off).

One hardware address pin on the PCA9550 allows two devices to operate on the same bus.

PIN CONFIGURATION

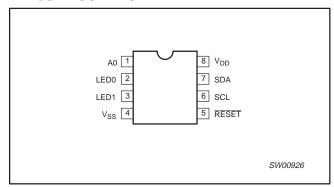

Figure 1. Pin configuration

PIN DESCRIPTION

| PIN NUMBER | SYMBOL | FUNCTION |
|---------------|-----------------|------------------------|
| 1 | A0 | Address input 0 |
| 2 | LED0 | LED driver 0 |
| 3 | LED1 | LED driver 1 |
| 4 | V _{SS} | Supply ground |
| 5 | RESET | Active low reset input |
| 6 | SCL | Serial clock line |
| 7 | SDA | Serial data line |
| 8 | V_{DD} | Supply voltage |

ORDERING INFORMATION

| PACKAGES | TEMPERATURE RANGE | ORDER CODE | DRAWING NUMBER | |
|---------------------|-------------------|------------|----------------|--|
| 8-Pin Plastic SO | −40 to +85 °C | PCA9550D | SOT96-1 | |
| 8-Pin Plastic TSSOP | −40 to +85 °C | PCA9550DP | SOT505-1 | |

Standard packing quantities and other packaging data is available at www.philipslogic.com/packaging. I²C is a trademark of Philips Semiconductors Corporation.

PCA9550

BLOCK DIAGRAM

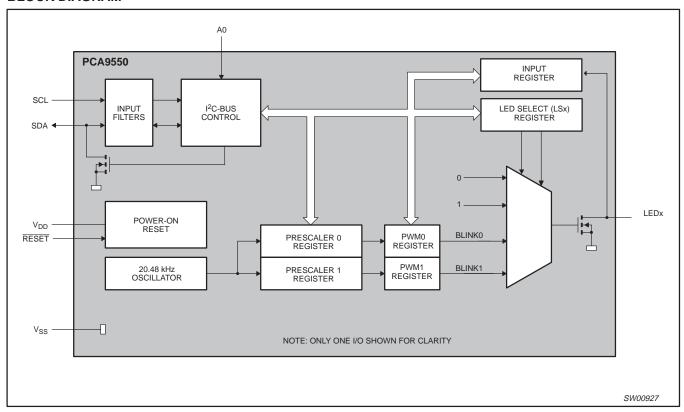

Figure 2. Block diagram

2-bit I²C LED driver with programmable blink rates

PCA9550

DEVICE ADDRESSING

Following a START condition the bus master must output the address of the slave it is accessing. The address of the PCA9550 is shown in Figure 3. To conserve power, no internal pullup resistors are incorporated on the hardware selectable address pins and they must be pulled HIGH or LOW.

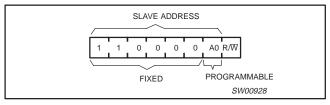

Figure 3. Slave address

The last bit of the slave address defines the operation to be performed. When set to logic 1 a read is selected while a logic 0 selects a write operation.

CONTROL REGISTER

Following the successful acknowledgement of the slave address, the bus master will send a byte to the PCA9550 which will be stored in the Control Register.

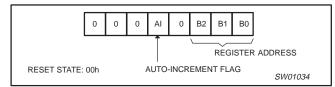

Figure 4. Control register

CONTROL REGISTER DEFINITION

| B2 | В1 | В0 | REGISTER NAME | TYPE | REGISTER FUNCTION |
|----|----|----|------------------|----------------|--------------------------|
| 0 | 0 | 0 | INPUT | READ | INPUT REGISTER |
| 0 | 0 | 1 | PSC0 | READ/ WRITE | FREQUENCY PRESCALER 0 |
| 0 | 1 | 0 | PWM0 | READ/ WRITE | PWM REGISTER 0 |
| 0 | 1 | 1 | PSC1 | READ/ WRITE | FREQUENCY PRESCALER 1 |
| 1 | 0 | 0 | PWM1 | READ/ WRITE | PWM REGISTER 1 |
| 1 | 0 | 1 | LS0 | READ/ WRITE | LED SELECTOR |

REGISTER DESCRIPTION

The lowest 3 bits are used as a pointer to determine which register will be accessed.

If the auto-increment flag is set, the three low order bits of the Control Register are automatically incremented after a read or write. This allows the user to program the registers sequentially. The contents of these bits will rollover to '000' after the last register is accessed.

Only the 3 least significant bits are affected by the AI flag.

Unused bits must be programmed with zeroes.

INPUT — INPUT REGISTER

| bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---------|---|---|---|---|---|---|---|---|
| Default | Χ | Χ | Χ | Χ | Х | Χ | Х | Χ |

The INPUT register reflects the state of the device pins. Writes to this register will be acknowledged but will have no effect.

PSC0 — FREQUENCY PRESCALER 0

| bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---------|---|---|---|---|---|---|---|---|
| default | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

PSC0 is used to program the period of the PWM output.

The period of BLINK0 = $\frac{(PSC0 + 1)}{40}$

PWM0 — PWM REGISTER 0

| bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---------|---|---|---|---|---|---|---|---|
| default | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

The PWM0 register determines the duty cycle of BLINK0. The outputs are HIGH (LED off) when the count is less than the value in PWM0 and HIGH when it is greater. If PWM0 is programmed with 00h, then the PWM0 output is always LOW.

The duty cycle of BLINK0 is: $\frac{PWM0}{256}$

PSC1 — FREQUENCY PRESCALER 1

| bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---------|---|---|---|---|---|---|---|---|
| default | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

PSC1 is used to program the period of PWM output.

The period of BLINK1 = $\frac{(PSC1 + 1)}{40}$

PWM1 — PWM REGISTER 1

| bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---------|---|---|---|---|---|---|---|---|
| default | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

The PWM1 register determines the duty cycle of BLINK1. The outputs are HIGH (LED off) when the count is less than the value in PWM1 and HIGH when it is greater. If PWM1 is programmed with 00h, then the PWM1 output is always LOW.

The duty cycle of BLINK1 is: $\frac{PWM1}{256}$

LS0 — LED SELECTOR

| | | | | | LEI | D 1 | LEI | D 0 |
|---------|---|---|---|---|-----|-----|-----|-----|
| bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| default | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 1 |

The LSx LED select registers determine the source of the LED data.

00 = Output is set low (LED on)

01 = Output is set high (LED off - default)

10 = Output blinks at PWM0 rate

11 = Output blinks at PWM1 rate

2-bit I²C LED driver with programmable blink rates

PCA9550

POWER-ON RESET

When power is applied to V_{DD} , an internal Power On Reset holds the PCA9550 in a reset state until V_{DD} has reached V_{POR} . At this point, the reset condition is released and the PCA9550 registers are initialized to their default states, all zeroes causing all the channels to be deselected.

EXTERNAL RESET

A reset can be accomplished by holding the $\overline{\text{RESET}}$ pin low for a minimum of t_W . The PCA9550 registers and I²C state machine will be held in their default state until the $\overline{\text{RESET}}$ input is once again high.

This input typically requires a pull-up resistor to V_{DD}.

CHARACTERISTICS OF THE I2C-BUS

The I²C-bus is for 2-way, 2-line communication between different ICs or modules. The two lines are a serial data line (SDA) and a serial clock line (SCL). Both lines must be connected to a positive supply via a pull-up resistor when connected to the output stages of a device. Data transfer may be initiated only when the bus is not busy.

Bit transfer

One data bit is transferred during each clock pulse. The data on the SDA line must remain stable during the HIGH period of the clock pulse as changes in the data line at this time will be interpreted as control signals (see Figure 5).

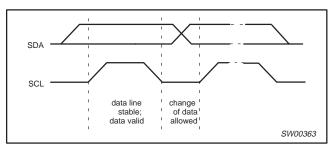

Figure 5. Bit transfer

Start and stop conditions

Both data and clock lines remain HIGH when the bus is not busy. A HIGH-to-LOW transition of the data line, while the clock is HIGH is defined as the start condition (S). A LOW-to-HIGH transition of the data line while the clock is HIGH is defined as the stop condition (P) (see Figure 6).

System configuration

A device generating a message is a transmitter: a device receiving is the receiver. The device that controls the message is the master and the devices which are controlled by the master are the slaves (see Figure 7).

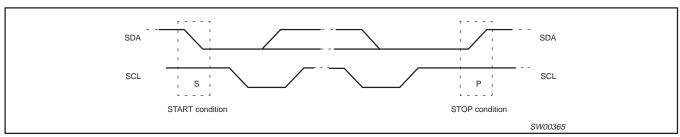

Figure 6. Definition of start and stop conditions

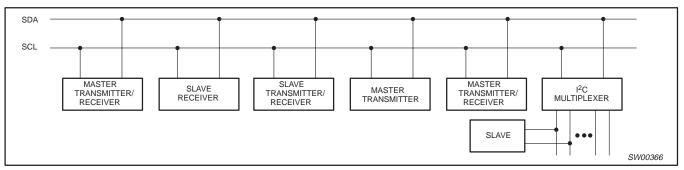

Figure 7. System configuration

2-bit I²C LED driver with programmable blink rates

PCA9550

Acknowledge

The number of data bytes transferred between the start and the stop conditions from transmitter to receiver is not limited. Each byte of eight bits is followed by one acknowledge bit. The acknowledge bit is a HIGH level put on the bus by the transmitter whereas the master generates an extra acknowledge related clock pulse.

A slave receiver which is addressed must generate an acknowledge after the reception of each byte. Also a master must generate an acknowledge after the reception of each byte that has been clocked out of the slave transmitter. The device that acknowledges has to pull down the SDA line during the acknowledge clock pulse, so that the SDA line is stable LOW during the HIGH period of the acknowledge related clock pulse, set-up and hold times must be taken into account.

A master receiver must signal an end of data to the transmitter by not generating an acknowledge on the last byte that has been clocked out of the slave. In this event, the transmitter must leave the data line HIGH to enable the master to generate a stop condition.

PCA9550

Programming example

The following example will show how to set LED0 to blink at 1 Hz at a 50% duty cycle. LED1 will be set to blink at 4 Hz, 25% duty cycle.

Table 1.

| | I ² C-bus |
|---|----------------------|
| Start | S |
| PCA9550 address | COh |
| PSC0 subaddress + auto-increment | 11h |
| Set prescaler PSC0 to achieve a period of 1 second: Blink period = $1 = \frac{PSC0 + 1}{40}$ PSC0 = 39 | 27h |
| Set PWM0 duty cycle to 50%: $\frac{PWM0}{256} = 0.5$ | 80h |
| Set prescaler PWM1 to achieve a period of 0.25 seconds: Blink period = $0.25 = \frac{PSC1 + 1}{40}$ PSC1 = 9 | 09h |
| Set PWM1 output duty cycle to 25%: $\frac{PWM1}{256} = 0.25$ | 40h |
| Set LED0 set to PWM0 and LED1 set to blink at PWM1 | OEh |
| Stop | Р |

ABSOLUTE MAXIMUM RATINGS

In accordance with the Absolute Maximum Rating System (IEC 134)

| SYMBOL | PARAMETER | CONDITIONS | MIN | MAX | UNIT |
|------------------|-------------------------------|------------|-----------------------|------|------|
| V_{DD} | Supply voltage | | -0.5 | 6.0 | V |
| V _{I/O} | DC voltage on an I/O | | V _{SS} - 0.5 | 5.5 | V |
| I _{I/O} | DC output current on an I/O | | _ | ±25 | mA |
| I _{DD} | Supply current | | _ | _ | mA |
| I _{SS} | Supply current | | _ | 100 | mA |
| P _{tot} | Total power dissipation | | _ | 400 | mW |
| T _{stg} | Storage temperature range | | -65 | +150 | °C |
| T _{amb} | Operating ambient temperature | | -40 | +85 | °C |

HANDLING

Inputs and outputs are protected against electrostatic discharge in normal handling. However, to be totally safe, it is desirable to take precautions appropriate to handling MOS devices. Advice can be found in Data Handbook IC24 under "Handling MOS devices".

DC CHARACTERISTICS

 V_{DD} = 2.3 to 5.5 V; V_{SS} = 0 V; T_{amb} = -40 to +85 °C; unless otherwise specified.

| SYMBOL | PARAMETER | CONDITIONS | MIN | TYP | MAX | UNIT |

Definitions

Short-form specification — The data in a short-form specification is extracted from a full data sheet with the same type number and title. For detailed information see the relevant data sheet or data handbook.

Limiting values definition — Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 60134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.

Application information — Applications that are described herein for any of these products are for illustrative purposes only. Philips Semiconductors make no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

Disclaimers

Life support — These products are not designed for use in life support appliances, devices or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips Semiconductors customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips Semiconductors for any damages resulting from such application.

Right to make changes — Philips Semiconductors reserves the right to make changes, without notice, in the products, including circuits, standard cells, and/or software, described or contained herein in order to improve design and/or performance. Philips Semiconductors assumes no responsibility or liability for the use of any of these products, conveys no license or title under any patent, copyright, or mask work right to these products, and makes no representations or warranties that these products are free from patent, copyright, or mask work right infringement, unless otherwise specified.
