Description

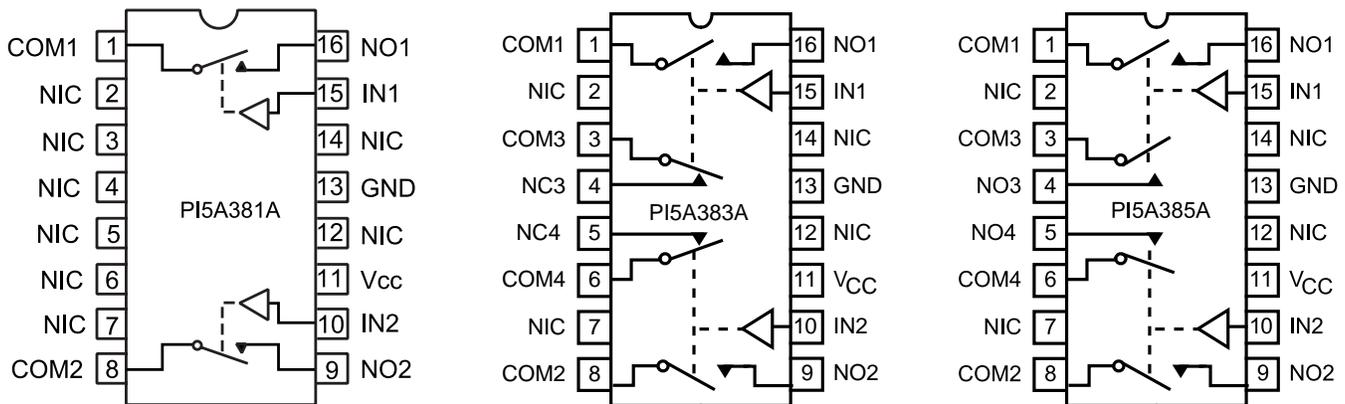

The PI5A381/383/385A are dual monolithic analog switches designed for single-supply operation. These high-precision devices are ideal for low-distortion audio, video signal switching and routing.

The PI5A381 is a dual single-pole single-throw (SPST), normally open (NO) switch. The PI5A383 is a dual single-pole double-throw (SPDT) switch. The PI5A385 is a dual double-pole single-throw (DPST), normally open (NO) function.

Each switch conducts current equally well in either direction when on. When off they block voltages up to the power-supply rails.

The PI5A381/383/385 are fully specified with +5V, and +3.3V supplies. With +5V, they guarantee <10Ω on-resistance. On-resistance matching between channels is within 2Ω. On-resistance flatness is less than 4Ω over the specified range. The PI5A38X family guarantees fast switching speeds (t_{ON} < 15ns).

These products are available in the 16-pin narrow-body SOIC, QSOP, and PDIP packages for operation over the industrial (-40°C to +85°C) temperature range.

Notes:

- The algebraic convention, where the most negative value is a minimum and the most positive is a maximum, is used in this data sheet.
- Typical values are for DESIGN AID ONLY, not guaranteed or subject to production testing.
- Guaranteed by design.
- ΔR_{ON} = R_{ON} max - R_{ON} min.
- Flatness is defined as the difference between the maximum and minimum value of on-resistance measured.
- Leakage parameters are 100% tested at maximum rated hot temperature and guaranteed by correlation at +25°C.
- Off Isolation = 20log₁₀ [V_{COM} / (V_{NO} or V_{NC})]. See figure 3.
- Between any two switches. See figure 4.
- D = R_{FLAT(ON)}/R_L.
