Product Description:

Pericom Semiconductor's PI5C series of BusSwitch circuits are produced in the Company's advanced sub-micron CMOS technology, achieving industry leading speed.

The PI5C16210 is configured as 20-bit, 2-port bus switches designed with a low ON resistance (5 Ohm) allowing inputs to be connected directly to outputs. The bus switch creates no additional propagational delay or additional ground bounce noise. The switches are turned ON by the Bus Enable (xOE) input signal.

Capacitance (TA = 25°C, f = 1 MHz)

Parameters ⁽⁵⁾	Description	Test Conditions	Typ	Units
C _{IN}	Input Capacitance	V _{IN} =0V or 3V	4.5	pF
C _{OFF}	A/B Capacitance, Switch Off	V _{IN} =0V or 3V	5.5	pF

Notes:

1. For Max. or Min. conditions, use appropriate value specified under Electrical Characteristics for the applicable device type.
2. Typical values are at V_{CC} = 5.0V, TA = 25°C ambient and maximum loading.
3. Not more than one output should be shorted at one time. Duration of the test should not exceed one second.
4. Measured by the voltage drop between A and B pin at indicated current through the switch. ON resistance is determined by the lower of the voltages on the two (A,B) pins.
5. This parameter is determined by device characterization but is not production tested.

Power Supply Characteristics

Parameters	Description	Test Conditions ⁽¹⁾		Min.	Typ ⁽²⁾	Max.	Units
Icc	Quiescent Power Supply Current	Vcc = Max.	Vin = GND or Vcc		0.1	10	µA
ΔIcc	Supply Current per Input @ TTL HIGH	Vcc = Max.	Vin = 3.4V ⁽³⁾			2.5	mA
ICCD	Supply Current per Input per MHz ⁽⁴⁾	Vcc = Max., A and B Pins Open Control Input Toggling 50% Duty Cycle				0.25	mA/ MHz

Notes:

1. For Max. or Min. conditions, use appropriate value specified under Electrical Characteristics for the applicable device.
2. Typical values are at Vcc = 5.0V, +25°C ambient.
3. Per TTL driven input (Vin = 3.4V, control inputs only); A and B pins do not contribute to Icc.
4. This current applies to the control inputs only and represent the current required to switch internal capacitance at the specified frequency. The A and B inputs generate no significant AC or DC currents as they transition. This parameter is not tested, but is guaranteed by design.

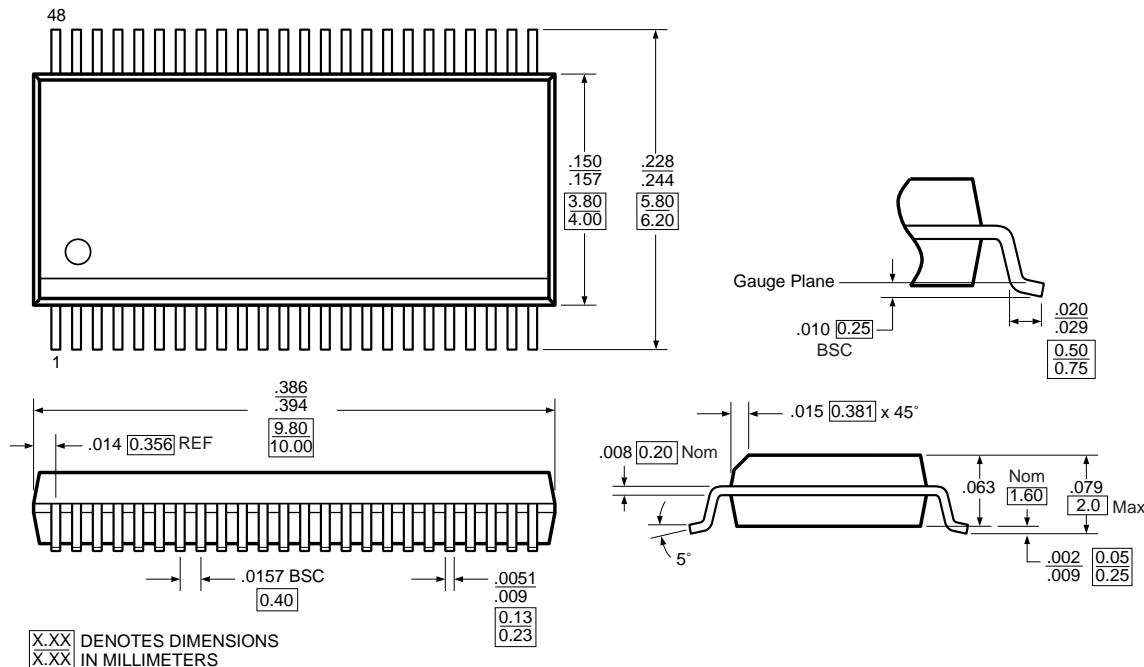

Switching Characteristics over Operating Range

Parameters	Description	Conditions ⁽¹⁾	PI5C16210				Unit	
			Vcc = 5V ±0.5V		Vcc = 4V			
			Min	Max	Min	Max		
tPLH tPHL	Propagation Delay ^(2,3) Ax to Bx, Bx to Ax	CL = 50 pF RL = 500ohm		0.25		0.25	ns	
			1.5	6.5		6.3	ns	
			1.5	5.5		5.5	ns	
tpZH tpZL	Bus Enable Time xOE to Ax or Bx							
tPHZ tPLZ	Bus Disable Time xOE to Ax or Bx							

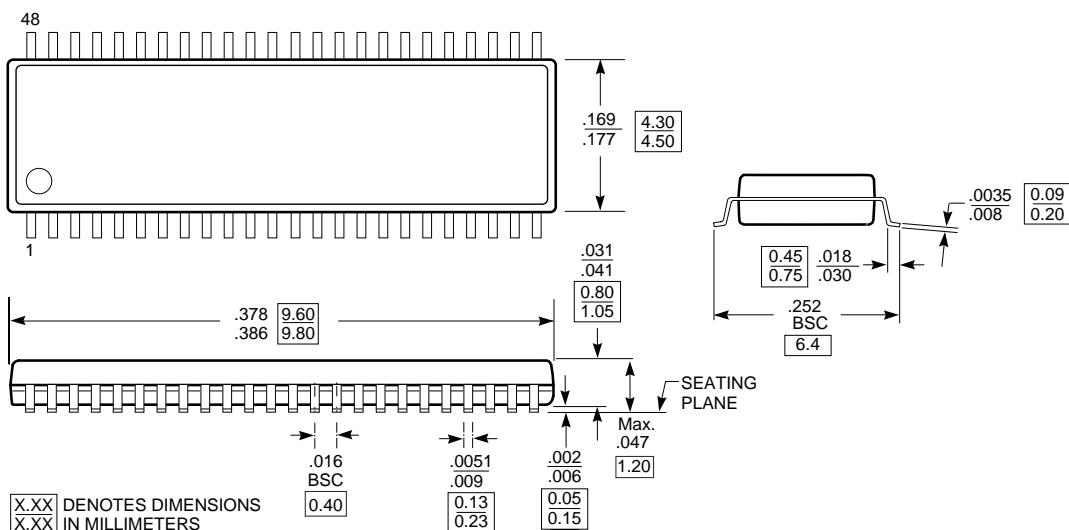

Notes:

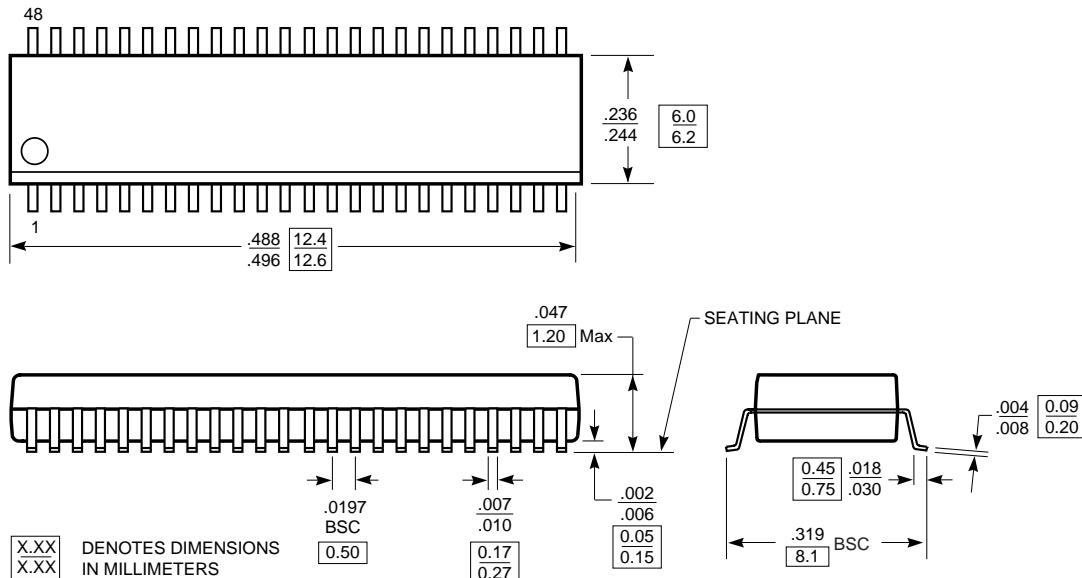

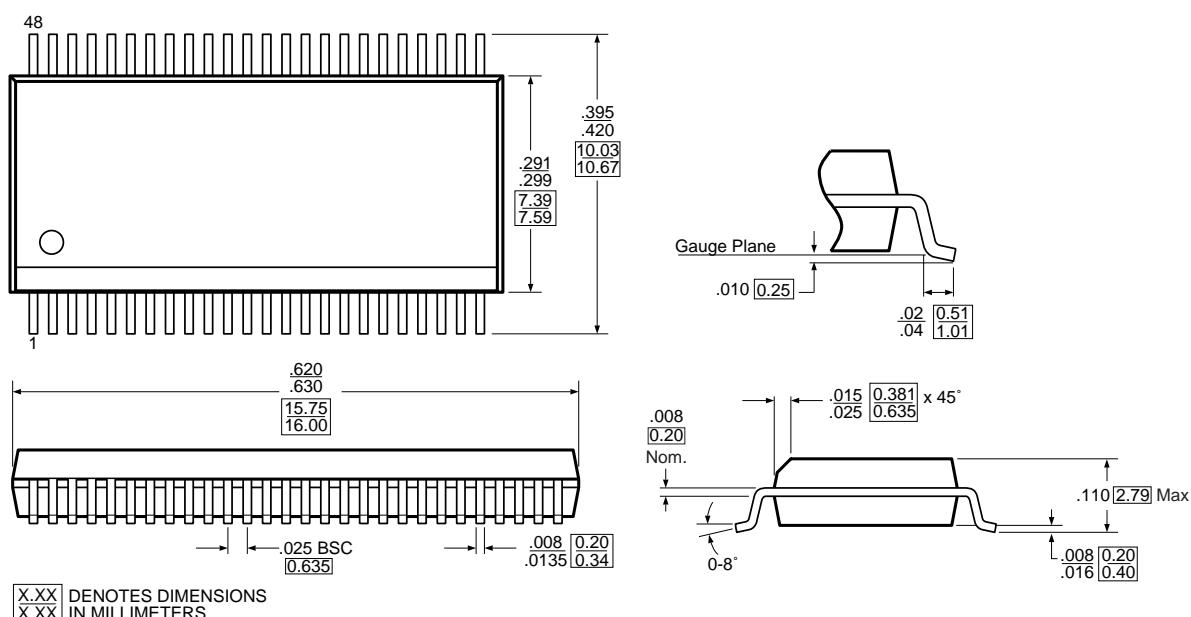

1. See test circuit and wave forms.
2. This parameter is guaranteed but not tested on Propagation Delays.
3. The bus switch contributes no propagational delay other than the RC delay of the ON resistance of the switch and the load capacitance. The time constant for the switch alone is of the order of 0.25 ns for 50 pF load. Since this time constant is much smaller than the rise/fall times of typical driving signals, it adds very little propagational delay to the system. Propagational delay of the bus switch when used in a system is determined by the driving circuit on the driving side of the switch and its interaction with the load on the driven side.
