Product Description

Pericom Semiconductor's PI74ALVC series of logic circuits are produced in the Company's advanced 0.5 micron CMOS technology, achieving industry leading speed.

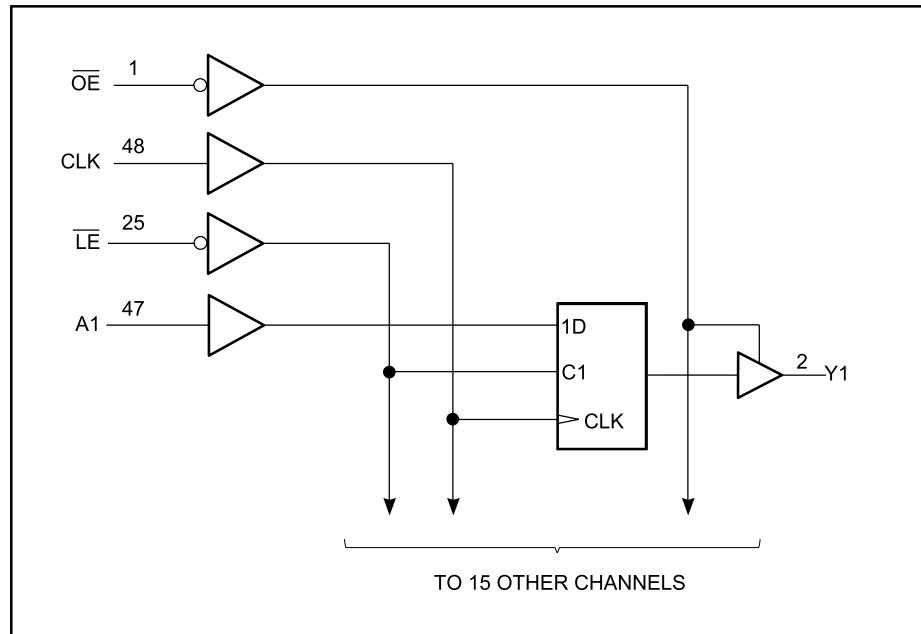

The 16-bit PI74ALVC162334 universal bus driver is designed for 2.3V to 3.6V V_{CC} operation.

Data flow from A to Y is controlled by Output Enable (\overline{OE}). The device operates in the transparent mode when \overline{LE} is LOW. When \overline{LE} is HIGH, the A data is latched if CLK is held at a high or low logic level. If \overline{LE} is HIGH, the A-data is stored in the latch/flip-flop on the low-to-high transition of CLK. When \overline{OE} is HIGH, the outputs are in the high-impedance state.

The outputs have equivalent 26 ohm series resistors to reduce overshoot and undershoot.

To ensure the high-impedance state during power up or power down, \overline{OE} should be tied to V_{CC} through a pullup resistor; the minimum value of the resistor is determined by the current-sinking capability of the driver.
