Product Description

Pericom Semiconductor's PI74ALVTC series of logic circuits are produced using the Company's advanced 0.35 micron CMOS technology, achieving industry leading speed.

The PI74ALVTC16827, is a 20-Bit non-inverting buffer/driver designed for 1.65V to 3.6V Vcc operation.

A buffer/driver is composed of two 10-bit sections with separate output-enable signals. For either 10-Bit buffer section, the two output-enable ($1\overline{OE}1$ and $1\overline{OE}2$ or $2\overline{OE}1$ and $2\overline{OE}2$ inputs must both be low for the corresponding Y outputs to be active. If either output-enable input is HIGH, the output of that 10-Bit buffer section are in the high-impedance state.

To ensure the high-impedance state during power up or power down, $\overline{OE}$ should be tied to Vcc through a pullup resistor whose minimum value is determined by the current sinking capability of the driver.

The family offers both I/O Tolerant, which allows it to operate in mixed 1.65/3.6V systems, and "Bus Hold," which retains the data input's last state preventing "floating" inputs and eliminating the need for pullup/down resistors.
