

PI74AVC+16374

2.5V 16-Bit Edge Triggered D-Type Flip-Flop with 3-State Outputs

Product Features

- PI74AVC+16374 is designed for low voltage operation, $V_{CC} = 1.65V$ to $3.6V$
- True $\pm 24mA$ Balanced Drive @ $3.3V$
- Compatible with Philips and T.I. AVC Logic family
- I_{OFF} supports partial power-down operation
- $3.6V$ I/O Tolerant inputs and outputs
- All outputs contain a patented DDC (Dynamic Drive Control) circuit that reduces noise without degrading propagation delay.
- Industrial operation at $-40^{\circ}C$ to $+85^{\circ}C$
- Available Packages:
 - 48-pin 240-mil wide plastic TSSOP
 - 48-pin 173-mil wide plastic TVSOP

Product Description

Pericom Semiconductor's PI74AVC+ series of logic circuits are produced using the Company's advanced submicron CMOS technology, achieving industry leading speed.

The PI74ALVCH16374 is particularly suitable for implementing buffer registers, I/O ports, bidirectional bus drivers, and working registers. This device can be used as two 8-bit flip-flops or one 16-bit flip-flop. On the positive transition of the Clock (CLK) input, the Q outputs of the flip-flop take on the logic levels set up at the data (D) inputs. $\overline{OE}$ can be used to place the eight outputs in either a normal logic state (high or low logic levels) or a high-impedance state. In that state, the outputs neither load nor drive the bus lines significantly. The high-impedance state and the increased drive provide the capability to drive bus lines without need for interface or pullup components. $\overline{OE}$ does not affect internal operations of the flip-flop. Old data can be retained or new data can be entered while the outputs are in the high-impedance state.

To ensure the high-impedance state during power up or power down, $\overline{OE}$ should be tied to V_{CC} through a pullup resistor; the minimum value of the resistor is determined by the current-sinking capability of the driver.

Maximum Ratings (Above which the useful life may be impaired. For user guidelines, not tested.)

Supply voltage range, V_{CC}	−0.5V to +4.6V
Input voltage range, V_I	−0.5V to +4.6V
Voltage range applied to any output in the high-impedance or power-off state, $V_O^{(1)}$	−0.5V to +4.6V
Voltage range applied to any output in the high or low state, $V_O^{(1,2)}$	−0.5V to $V_{CC}+0.5V$
Input clamp current, I_{IK} ($V_I < 0$)	−50mA
Output clamp current, I_{OK} ($V_O < 0$)	−50mA
Continuous output current, I_O	±50mA
Continuous current through each V_{CC} or GND	±100mA
Package thermal impedance, $\theta_{JA}^{(3)}$: package A	64°C/W
package K	48°C/W
Storage Temperature range, T_{stg}	−65°C to 150°C

Notes:

Stresses greater than those listed under MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

1. Input & output negative-voltage ratings may be exceeded if the input and output current rating are observed.
2. Output positive-voltage rating may be exceeded up to 4.6V maximum if the output current rating is observed.
3. The package thermal impedance is calculated in accordance with JESD 51.
