

RC4136

General Performance Quad 741 Operational Amplifier

Features

- Unity gain bandwidth – 3 MHz
- Short circuit protection
- No frequency compensation required
- No latch-up

- Large common mode and differential voltage ranges
- Low power consumption
- Parameter tracking over temperature range
- Gain and phase match between amplifiers

Description

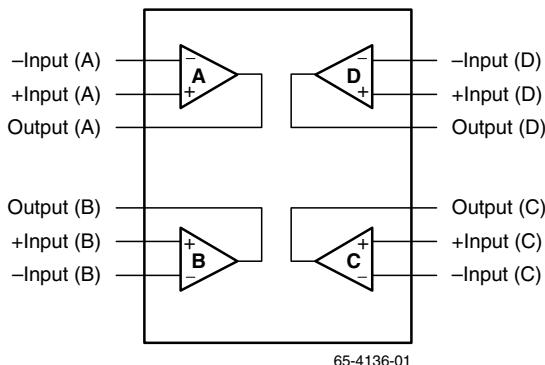

The RC4136 is made up of four 741 type independent high gain operational amplifiers internally compensated and constructed on a single silicon chip using the planar epitaxial process.

This amplifier meets or exceeds all specifications for 741 type amplifiers. Excellent channel separation allows the use

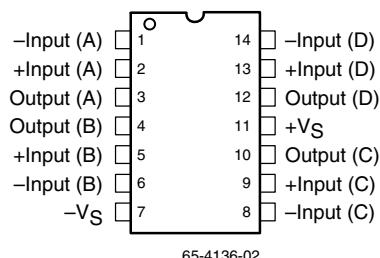

of the RC4136 quad amplifier in all 741 operational amplifier applications providing the highest possible packaging density.

The specially designed low noise input transistors allow the RC4136 to be used in low noise signal processing applications such as audio preamplifiers and signal conditioners.

Absolute Maximum Ratings(beyond which the device may be damaged)¹

Parameter		Min	Typ	Max	Units
Supply Voltage	RC4136			±18	V
Input Voltage ²				±30	V
Differential Input Voltage				30	V
Output Short Circuit Duration ³	Indefinite				
PDTA < 50°C	SOIC			300	mW
	PDIP			468	mW
Operating Temperature	RC4136	0		70	°C
Storage Temperature		-65		150	°C
Junction Temperature	SOIC, PDIP			125	°C
Lead Soldering Temperature (60 seconds)	DIP			300	°C
	SOIC			260	°C

Notes:

1. Functional operation under any of these conditions is NOT implied. Performance and reliability are guaranteed only if Operating Conditions are not exceeded.
2. For supply voltages less than ±15V, the absolute maximum input voltage is equal to the supply voltage.
3. Short circuit may be to ground, typically 45 mA.

RC4136 Versus LM324

Although the LM324 is an excellent device for single-supply applications where ground sensing is important, it is a poor substitute for four 741s in split supply circuits. The simplified input circuit of the RC4136 exhibits much lower noise

than that of the LM324 and exhibits no crossover distortion as compared with the LM324 (see Figure 16). The LM324 shows significant crossover distortion and pulse delay in attempting to handle a large signal input pulse.
