

## **VOLTAGE REGULATOR (with Wide Input Voltage Range) with RESET R1150Hxxxx series**

### **■ OUTLINE**

The R1150Hxxxx series are voltage regulator (VR) ICs equipped with a voltage detector (VDET) by CMOS process. VR function of the R1150Hxxxx has features of low dropout voltage, high output voltage accuracy, and ultra-low supply current. Each of the R1150HxxxA types includes also a chip enable circuit. The output of built-in voltage detector is Nch open drain type. The R1150HxxxC/D types have a pin for connecting external capacitor to set a certain reset delay time instead of chip enable control pin.

The regulator output voltage and the detector threshold voltage are fixed in the IC, Output Voltage Accuracy is  $\pm 2.0\%$ , while Detector Threshold Accuracy is  $\pm 2.5\%$ . The R1150HxxxA (with chip enable function) and C series can supervise input voltage by the built-in detector. R1150HxxxB type can supervise SENSE pin voltage by the built-in detector. R1150HxxxD type can supervise VOUT voltage, or Regulator Output Voltage of this IC itself.

Since the package for these ICs is the SOT-89-5 package, high density mounting of the ICs on boards is possible.

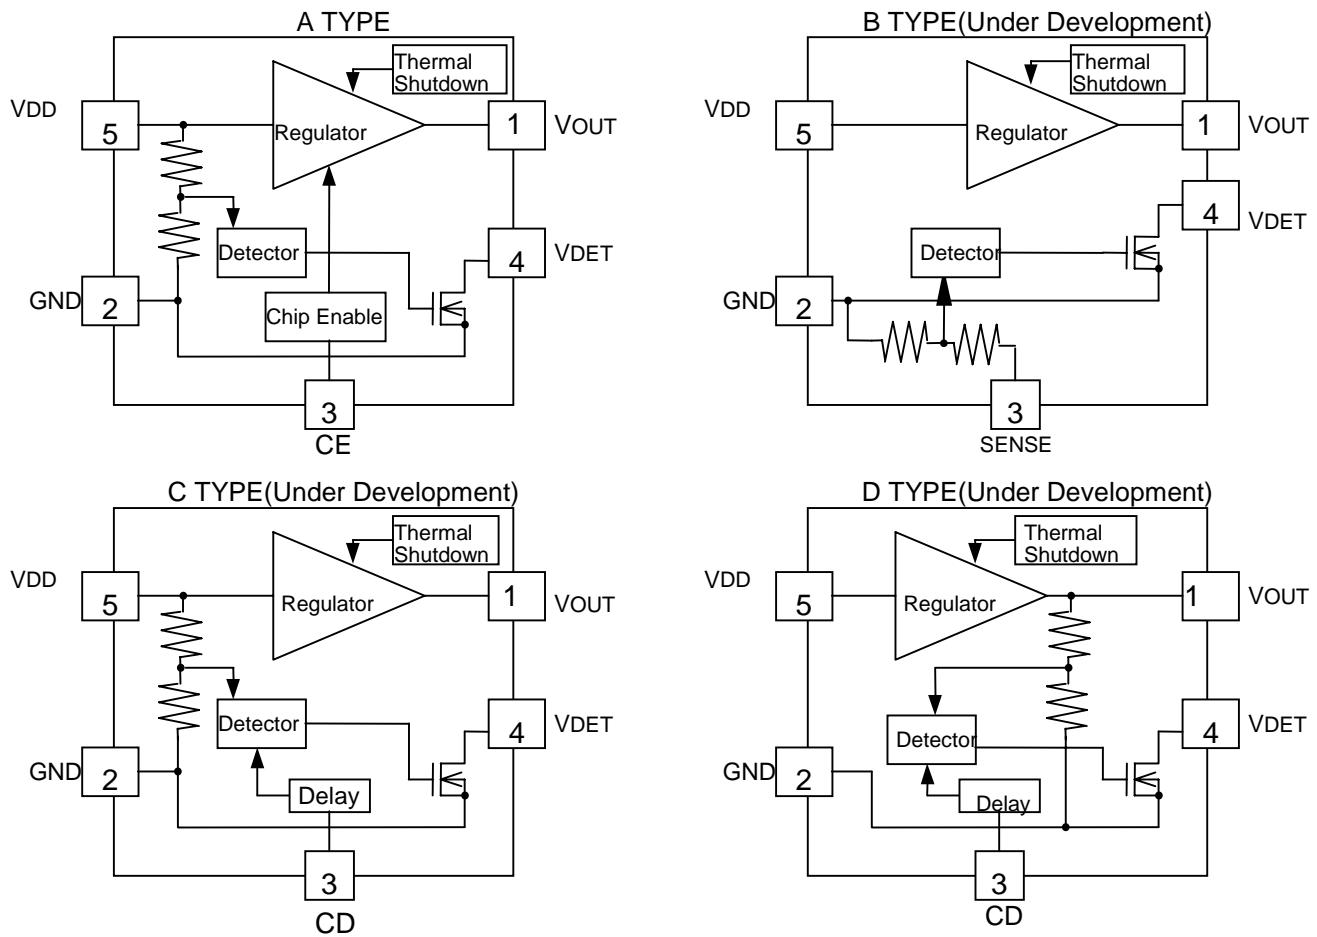

### **■ FEATURES**

- Ultra-Low Supply Current ..... TYP. 7 $\mu$ A
- Input Voltage ..... MAX. 24V
- Output Voltage (VR) ..... Stepwise setting with a step of 0.1V in the range of 2.1V to 14.0V
- Detector Threshold Voltage (VDET) ..... Stepwise setting with a step of 0.1V in the range of 2.3V to 15.0V
- High Output Voltage Accuracy .....  $\pm 2.0\%$ (VR)  $\pm 2.5\%$ (VD)
- Output Current ..... MIN. 150mA(VOUT=5V)
- Small Package ..... SOT-89-5
- Built-in Current Limit Circuit, Thermal Shutdown Circuit (VR)
- Monitoring VDD voltage ..... A/C type
  - Monitoring sense pin (<sub>SENSE</sub>) voltage ..... B type
  - Monitoring VOUT pin voltage ..... D type

### **■ APPLICATIONS**

- Power source and Reset circuit for cameras, videos and mobile telecommunication equipment.
- Power source and Reset circuit for battery-operated equipment.
- Power source and Reset circuit for home appliances.

## ■ SELECTION GUIDE

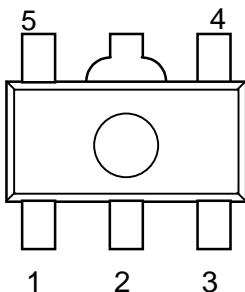

The output voltage and the usage of pin No.3 (as a kind of types in the R1150Hxxxx series) can be selected at the user's request. The selection can be made with designating the part number as follows;

R1150HXXXX-XX ← Part Number

↑ ↑ ↑ ↑  
a b c d

Code	Contents
a	Designation of package type; H : SOT89-5
b	Serial Number for Voltage Setting
c	Designation of option; A: Built-in Chip Enable Circuit (VDET supervises VIN level.) B: VDET supervises SENSE pin. C: Used with an external capacitor for setting output delay time of VDET. (VDET supervises VIN.) D: Used with an external capacitor for setting output delay time of VDET. (VDET supervises VOUT.) B/C/D versions are under development.
d	Designation of Taping Type; (Refer to Taping Specifications)

## ■ TECHNICAL NOTES

### Phase Compensation

Phase Compensation of the R1150H Series has been made internally for stable operation even though the load current would vary. Therefore, without the capacitors,  $C_{IN}$  and  $C_{OUT}$ , Output Voltage is regulated, but for more stable operation, use capacitors as  $C_{IN}$  and  $C_{OUT}$ . Recommended value is in the range from  $0.1\mu F$  to  $1.0\mu F$ . Wiring should be made as short as possible.

### PCB layout

Current flows into wiring for VDD or GND, thus, if the impedance of the wiring is rather high, it may cause of making noise or unstable operation, thus width and pattern should be enough wide to avoid such problems. Connect the capacitor,  $C_{IN}$  between VDD pin and GND pin as close as possible.

### Thermal Shutdown

Thermal shutdown function is included in the R1150HxxxA/B/C/D Series, when the junction temperature is equal or more than  $+150^{\circ}C$ (TYP.), the operation of regulator would stop. After that, when the junction temperature is equal or less than  $+120^{\circ}C$ (TYP.), the operation of regulator would restart. Unless the cause of rising temperature would remove, the regulator repeats on and off, and output waveform would be like consecutive pulses.

### Chip Enable Circuit

Do not make voltage level of chip enable pin keep floating level, or in between  $V_{IH}$  and  $V_{IL}$ . Unless otherwise, Output voltage would be unstable or indefinite, or unexpected current would flow internally.
