

RC7310

High Speed Driver

Features

- High output slew rate (1.2 V/ns minimum)
- Wide output voltage range (-3.0V to +8V), and up to 10 Vp-p swings
- 250 MHz minimum operation for ECL swings
- Wide input common mode range for ease of interface to ECL as well as TTL and CMOS
- Output short-circuit protection with current limiter and thermal shutdown
- 100 mA dynamic switching current drive
- Absolute slew rate control
- Low output voltage offset (30 mV typ.) and output offset drift (0.1 mV/°C typ.)
- Low input bias current (1 μ A typ.) and current drift (40 nA/°C typ.) for output level program voltage allows direct coupling to a DAC output
- Available in 28-pin PLCC

Applications

- Differential line driver/receiver
- Precision waveform generator
- Level translator
- Switch driver
- Laser driver
- CRT preamplifier

Description

The RC7310 is a low cost High Speed Driver capable of over 250 MHz operation at ECL levels and greater than 1.2 V/ns slew rate for 5 Vp-p output. The driver offers programmable output levels between -3.0V and +8V and an output amplitude up to 10 Vp-p. It is therefore capable of driving any logic family such as ECL, TTL and CMOS. The high and low limits of the output swing are set through the program pins V_H and V_L, respectively. The transfer characteristic from the program pins to the output pin is unity gain with low offset (30 mV typical) and offset drift (0.1 mV/°C typical). The V_H and V_L inputs have been buffered to operate with low bias currents (1.0 μ A typical) allowing direct coupling to the output of a DAC.

The RC7310 is normally driven by ECL levels. However, the input common mode range, -2V to +6V, is wide enough to accommodate TTL or CMOS input signals. When driven with a single ended signal the other input of the RC7310 must be tied to the appropriate threshold voltage.

The RC7310 is specified at nominal power supply values of 10V and -5.2V, and commensurate output voltage swing limits of -3.0V and +8V.

Block Diagram

65-7310-01

Description (continued)

The supply rails may be raised by 2V to achieve an output high level (V_{OH}) of +1.0V, or lowered by 2V to achieve an output low level (V_{OL}) of -5V. At all times there must be at least a 2V margin between the positive supply and the maxi-

mum value of V_{OH} , and between the negative supply and the minimum value of V_{OL} .

The RC7310 is implemented using Fairchild Semiconductor's high performance precision Complementary Bipolar Process (CBiP).

Pin Assignments

Pin Definitions

Pin Name	Pin Number	Pin Function Description
CIM1, CIM2	3, 4	An optional 10,000 pF chip capacitor could be placed between CIM1 and CIM2 to improve impedance matching across different voltage swings. With this capacitor, output impedance stays more constant with changes in voltage swings. If not used, leave pins CIM1 and CIM2 open.
GND	16, 28	Chip ground. These pins should be connected to the printed circuit board's ground plane at the pins.
OF	2	On chip filter to improve output waveform (optional). This pin connection is optional and should be left unconnected if not used. When used, the OF pin should be fed to the termination node that is directly connected to the DUT.
SRCA	12	Absolute slew rate control. By applying current at this pin, small changes in slew rate can be programmed with an external DAC. This control pin affects both positive and negative edge rates. If this slew rate control is not desired this pin should be left open.
SRCM	11	Slew rate control matching. By applying current at this pin, small changes in slew rate can be programmed with an external DAC. This control pin adjusts the match between positive and negative edges. If this slew rate control is not desired this pin should be left open.
\overline{TS}	25	Active low output notifies thermal shutdown has occurred. In the event of a short-circuit or other fault that causes the die temperature to rise between 115°C and 160°C, the thermal shutdown will activate. If the fault persists, the device will toggle back and forth between shutdown and normal operation at a frequency in the tens of Hertz. \overline{TS} is an open collector output capable of driving two standard TTL loads. The \overline{TS} pins of several drivers may be wired together and input to a latch to indicate an alarm condition.
TST	5	Pin used for factory testing the thermal characteristics of the device. The pin should be left unconnected or tied to GND.

Pin Definitions (continued)

Pin Name	Pin Number	Pin Function Description
VCC	8	Quiet positive supply. The nominal value is 10V \pm 3%. For output high voltage levels (VOH) greater than the nominal value of +8V, VCC should be raised 2V above the maximum VOH value. Whenever VEE is lowered to provide margin at the output low level, VCC should also be lowered by the same amount. VCC should be bypassed to the ground plane with a 10,000 pF chip capacitor placed as close to the pin as possible.
VCCO	7	Positive supply for the output stage. This supply is brought out separately to minimize the supply noise generated when the output switches. VCCO should be bypassed to the ground plane with a 10,000 pF chip capacitor placed as close to the pin as possible and then immediately connected to VCC.
VEE	22	Quiet negative supply. The nominal value is -5.2V to \pm 5%. For output low voltage levels (VOL) less than 3V, VEE should be lowered 2V below the minimum VOL value. Whenever VCC is raised to provide margin at the output high level, VEE should be raised by the same amount. VEE should be bypassed to ground with a 10,000 pF chip capacitor placed as close to the pins as possible.
VEEO	23	Negative supply for the output stage. This supply is brought out separately to minimize the supply noise generated when the output switches. VEEO should be bypassed to the ground plane with a 10,000 pF chip capacitor placed as close to the pin as possible and then immediately connected to VEE.
VH	18	Analog program input that sets the output high level (VOH). The transfer characteristic from VH to VOH is nominally unity gain.
VHC	9	Bypass for analog program input high, VH. VHC should be bypassed to the ground plane with a 1000 pF chip capacitor placed as close to the pin as possible.
VIN+, VIN-	15, 14	Differential digital inputs. The output will toggle between the two levels dictated by VH and VL as the differential signal is switched. Although these inputs will normally be driven by ECL signals, they have a wide enough common mode range that any one of the inputs may be driven by a TTL or CMOS signal provided that the other input is tied to the appropriate threshold voltage.
VL	19	Analog program input that sets the output low level (VOL). The transfer characteristic from VL to VOL is nominally unity gain.
VLC	10	Bypass for analog program input low, VL. VLC should be bypassed to the ground plane with a 1000 pF chip capacitor placed as close to the pin as possible.
VO	1	Driver output of RC7310. The output impedance is 12.6 Ω \pm 1.5 Ω . The output is usually back terminated in the characteristic impedance of the driven transmission line. For a 50 Ω line, a 37.4 Ω \pm 1% or better resistor should be placed externally as close to the output pin as possible to minimize reflections and ringing. The resistor should also be able to dissipate 0.8W to sustain the short circuit current of the output.
NC	6, 13, 17, 20, 21, 24, 26, 27	No connection.

Absolute Maximum Ratings¹

Parameter		Min.	Max.	Unit
Positive power supply, V_{CC}			13	V
Negative power supply, V_{EE}			-8.2	V
Difference between V_{CC} and V_{EE}			16	V
Input voltage at V_{IN+} , V_{IN-}	V_{CC}	-12		V
	V_{EE}		+12	
Input voltage at V_H , V_L	V_{CC}	-13		V
	V_{EE}		+13	
Differential input voltage, $ V_{IN+} - V_{IN-} $			6	V
Difference between V_H and V_L , $(V_H - V_L)$			13	V
Driver output voltage	V_{CC}	-13		V
	V_{EE}		+13	
Output voltage at \overline{TS}			7	V
Duration of short-circuit to ground		Indefinite		
Operating temperature range		0	70	°C
Storage temperature range		-65	+125	°C
Lead temperature range (soldering 10 seconds)			300	°C

Notes:

1. Absolute Maximum Ratings are those beyond which the safety of the device cannot be guaranteed. They are not meant to imply that the device should be operated at these limits. If the device is subjected to the limits in the absolute maximum ratings for extended periods, its reliability may be impaired. The tables of Electrical Characteristics provide conditions for actual device operation.

Operating Conditions

Symbol	Parameter	Min.	Typ.	Max.	Unit
TC	Case operating temperature ¹	0		70	°C
VCC	Positive supply voltage	9.7	10.0	10.3	V
VEE	Negative supply voltage	-5.45	-5.2	-4.95	V
VCC – VEE	Difference between positive and negative supply		15.2	15.8	V
VOH, VOL	Range for output high level and output low level	VEE+2		VCC–2	V
VOH – VOL	Output amplitude	0.4		10.0	V
RT	Output back-termination resistor for RC7310		37.4		Ω

Note:

1. With air flow >300 lfpm.

LIFE SUPPORT POLICY

FAIRCHILD'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT OF FAIRCHILD SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and (c) whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury of the user.
2. A critical component in any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
