The S-8081B is a CMOS CR timer developed for appliances and industrial equipment use. It consists of a CR oscillator, a 20-stage divider, a power-on clear circuit, a trigger input chattering rejection circuit, an internal voltage regulator, a level shift circuit, and an output driver. It can be used as a high-precision, long-time monostable timer.

### ■ Features

- Wide power supply operating range : 4.5 to 16.5 V
- Low current consumption : 200  $\mu$ A max.(C = 200 k $\Omega$ , R = 0.0047  $\mu$ F, open output )
- Time can be set by external CR
- Excellent oscillation stability because of built-in voltage regulator
- Power-on clear circuit is integrated
- Both trigger I/O inverting operation and set/reset operation can be performed

### ■ Applications

- Time switch
- Long time delay generator

### ■ Pin Assignment

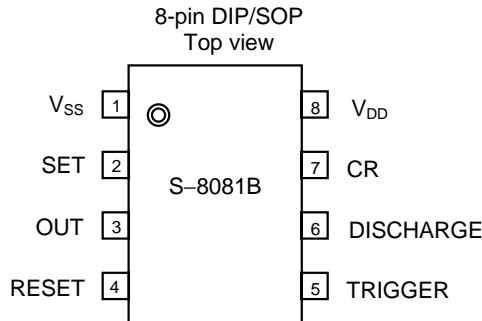

Figure 1

# CR TIMER

## S-8081 B

### ■ Timer Setting

The timer time  $t_{OUT}$  is decided by an external resistor  $R_T$  and an external capacitor  $C_T$ .

$$t_{OUT} = (K \times R_T \times C_T \times 2^{19}) \text{ sec.}$$

$K$ =time constant coefficient

$10 \text{ s} \leq t_{OUT} \leq 10 \text{ hours}$  (recommended)

$R_T \geq 50 \text{ k}\Omega$ ,  $C_T \geq 100 \text{ pF}$  (recommended)

Note : If other  $C_T$  or  $R_T$  is used than above recommended, the internal C and R influence  $t_{OUT}$  and it becomes different in each unit.

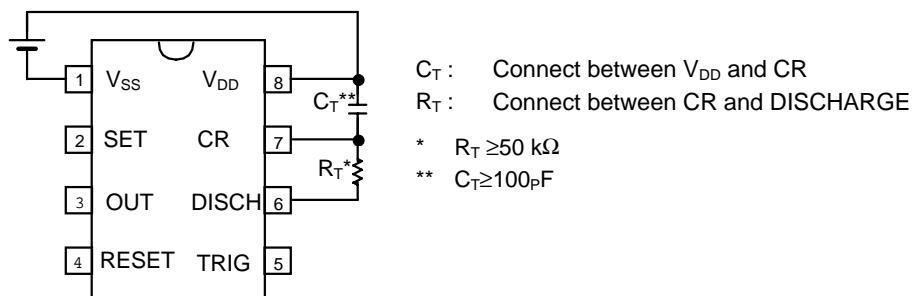

Figure 3 Connection of external  $C_T$  and  $R_T$

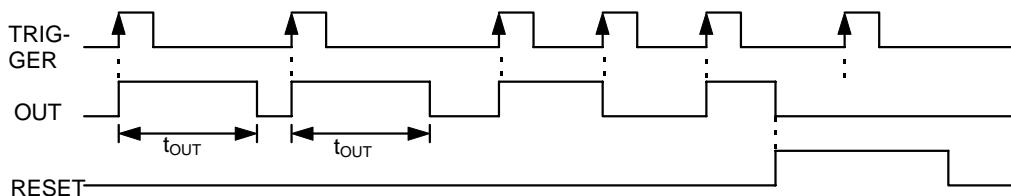

Figure 4 TRIGGER operation timing chart

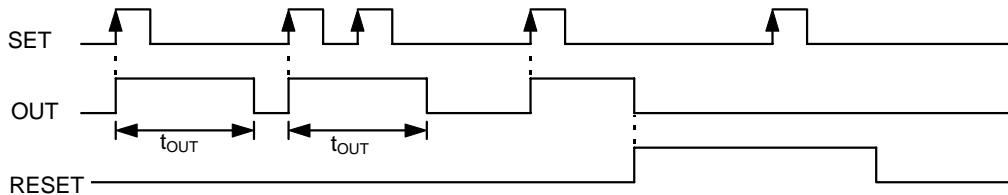

Figure 5 SET operation timing chart

$$t_{OUT} = t_{osc} \times 2^{19}$$

$$t_{osc} \approx K \times R_T \times C_T$$

(Recommended :  $R_T \geq 50 \text{ k}\Omega$ ,  $C_T \geq 100 \text{ pF}$ )

### ■ Operation

#### 1. SET terminal

At the rise of SET terminal, OUT goes high ( $V_{DD}$ ) and frequency dividing operation starts.

This terminal has a pull-down resistor built in.

#### 2. RESET terminal

By bringing RESET terminal high ( $V_{DD}$ ), OUT goes low ( $V_{ss}$ ) and the internal counter is reset.

Set or trigger input is ignored when reset is high.

This terminal has a pull-down resistor built in.

### 3. TRIGGER terminal

At the rise of TRIGGER terminal, OUT level is inverted. When OUT changes from low ( $V_{SS}$ ) to high ( $V_{DD}$ ), frequency dividing operation starts. When OUT changes from high ( $V_{DD}$ ) to low ( $V_{SS}$ ), the internal counter is reset. When starting TRIGGER operation during setting operation, reset the S-8081B before TRIGGER input. This terminal has a chattering rejection circuit and a pull-down resistor built in.

Chattering rejection time  $\approx t_{osc} \times 7$

### 4. CR and DISCHARGE terminals

CR oscillation circuit can be constructed by connecting a timing capacitor  $C_T$  between  $V_{DD}$  and CR terminals, and by connecting a timing resistor  $R_T$  between CR and DISCHARGE terminals.

Set the oscillation period ( $t_{osc}$ ) following the formula below.

$$t_{osc} \approx K \times R_T \times C_T$$

K : time constant coefficient

### 5. OUT terminal

At the rise of SET or TRIGGER terminal, OUT goes high ( $V_{DD}$ ) and frequency dividing operation starts. OUT goes low ( $V_{SS}$ ) after  $t_{osc} \times 2^{19}$ .

When OUT is high ( $V_{DD}$ ) if TRIGGER rises or RESET goes high ( $V_{DD}$ ), OUT goes low ( $V_{SS}$ ) and the internal counter is reset.

## ■ Absolute Maximum Ratings

**Table 1**

Unless otherwise specified:  $T_a=25^\circ C$

Parameter	Symbol	Conditions	Ratings	Unit
Power supply voltage	$V_{DD}$	$V_{SS}=0\text{ V}$	18	V
Input/output voltage*	$V_{IN}, V_{OUT}$		$V_{SS}-0.3$ to $V_{DD}+0.3$	V
Operating temperature	$T_{opr}$		-30 to +85	°C
Storage temperature	$T_{stg}$		-40 to +125	°C
Power dissipation	$P_D$	at $25^\circ C$	300	mW

\* Excluding DISCHARGE terminal

## ■ Electrical Characteristics

**Table 2**

$V_{DD}=12\text{ V}, V_{SS}=0\text{ V}, T_a=25^\circ C$

Parameter	Symbol	Conditions	Min.	Typ.	Max.	Unit
Operating power supply voltage	$V_{DD}$		4.5	—	16.5	V
Operating current consumption	$I_{DD}$	$R=200\text{ k}\Omega$ Open output $C=0.0047\text{ }\mu\text{F}$	—	—	200	$\mu\text{A}$
SET, RESET, TRIGGER input pull-down resistance	$R_{down}$	$V_{IH}=V_{DD}$	50	—	400	$\text{k}\Omega$
High level input voltage	$V_{IH}$		$0.8 \times V_{DD}$	—	$V_{DD}$	
Low level input voltage	$V_{IL}$		$V_{SS}$	—	$0.2 \times V_{DD}$	V
High level output current	$ I_{OH} $	$V_{OH}=5.7\text{ V}$ $V_{DD}=8.0\text{ V}$	10	15	—	
Low level output current	$ I_{OL} $	$V_{OL}=2.3\text{ V}$ $V_{DD}=8.0\text{ V}$	20	30	—	$\text{mA}$
Low level output voltage	$V_{OL}$	$V_{DD}=5.0\text{ V}$ $I_{OUT}=3.2\text{ mA}$	—	—	0.4	V
Time constant coefficient	K	$C=0.0047\text{ }\mu\text{F}$ $R=200\text{ k}\Omega$	1.276	1.450	1.624	—
CR osc	Power supply voltage fluctuation*	$ \Delta f/f_{osc} / \Delta V_{DD} $	$V_{DD}=4.5$ to $16\text{ V}$ $C=0.0047\text{ }\mu\text{F}$ $R=200\text{ k}\Omega$	—	0.05	—
	Temperature fluctuation*	$ \Delta f/f_{osc} / \Delta T $	$T_a=-20$ to $+60^\circ C$ $C=0.0047\text{ }\mu\text{F}$ $R=200\text{ k}\Omega$	—	0.10	—

\* Fluctuation of IC only

**■ AC Electrical Characteristics**

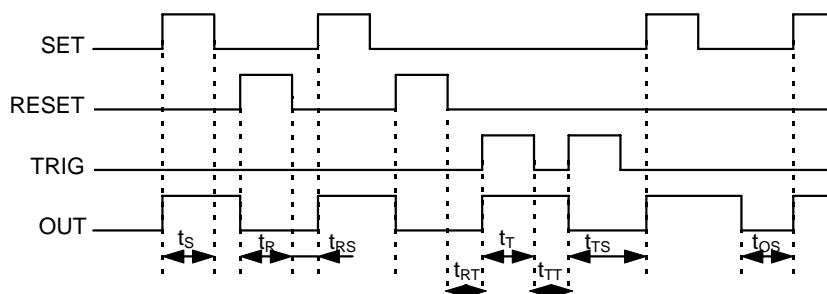

1. Input signal timing

**Table 3**

$V_{DD}=12\text{ V}$ ,  $V_{SS}=0\text{ V}$ ,  $T_a=25\text{ }^\circ\text{C}$

Parameter	Symbol	Min.	Typ.	Max.	Unit
SET pulse width	$t_S$	10	—	—	$\mu\text{s}$
RESET pulse width	$t_R$	10	—	—	$\mu\text{s}$
TRIG pulse width	$t_T$	$16 \times t_{osc}$	—	—	$\mu\text{s}$
RESET-SET pulse interval	$t_{RS}$	10	—	—	$\mu\text{s}$
RESET-TRIG pulse interval	$t_{RT}$	10	—	—	$\mu\text{s}$
TRIG pulse interval	$t_{TT}$	10	—	—	$\mu\text{s}$
SET input timing	$t_{TS}$	$t_T+10$	—	—	$\mu\text{s}$
Pulse interval between timer operation finish and SET	$t_{os}$	10	—	—	$\mu\text{s}$
Pulse interval between timer operation finish and TRIG	$t_{OT}$	10	—	—	$\mu\text{s}$

$t_{osc}$ : oscillating frequency, ( $t_{osc}=K \times R_T \times C_T$ )

RESET input has the precedence over SET or TRIG input.

**Figure 6**

2. TRIG input pulse width and operation status

**Table 4**

$V_{DD}=12\text{ V}$ ,  $V_{SS}=0\text{ V}$ ,  $T_a=25\text{ }^\circ\text{C}$

TRIG input pulse width	Operation
$\text{TRIG input pulse width} \geq 16 \times t_{osc}$	TRIG operation
$7 \times t_{osc} < \text{TRIG input pulse width} < 16 \times t_{osc}$	Indefinite*
$\text{TRIG input pulse width} \leq 7 \times t_{osc}$	No TRIG operation

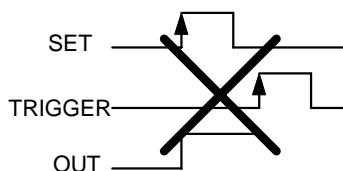

\*TRIG operation does not always start.

$t_{osc}$ : oscillating frequency

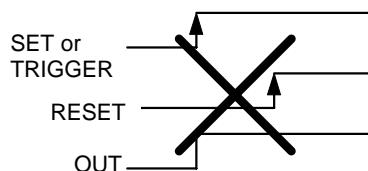

**■ Notes**

1. Notes on operation

- Do not start TRIGGER operation during setting operation (see Figure 7). When starting TRIGGER operation during setting operation, reset the S-8081B before TRIGGER input.
- Do not set the RESET terminal high while SET or TRIGGER terminal is at high level. Or, the S-8081B will enter acceleration test mode. (see Figure 8)

**Figure 7**

**Figure 8**

## 2. Status just after power-ON

A power-on clear circuit is built in the S-8081B and it initializes this IC at power-ON. During initialization, the S-8081B does not perform normal operation. Initialization time can not be defined clearly because it differs according to the voltage fluctuation at power-ON. See Table 5 for reference. Pay sufficient attention to the operation just after power-ON.

**Table 5**

Rise time	Initialization time*
<1 ms	1 ms
≥1 ms	Time duration from power-ON to the time when $V_{DD}$ reaches 4.5 V.

\* Time duration from power-ON. At this time, the S-8081B does not operate normally.

## 3. CR oscillation

CR oscillation circuit is always operating while power supply voltage is applied.

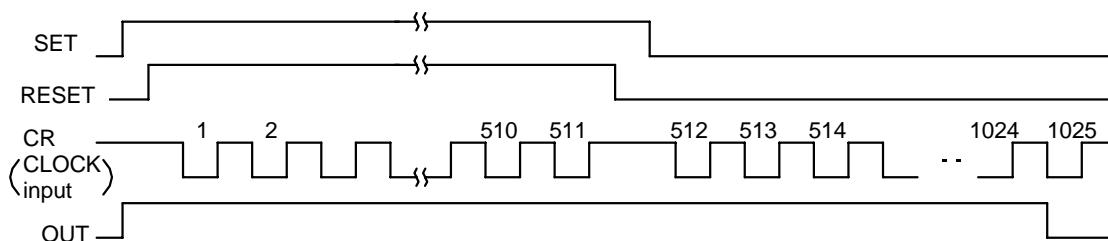

## 4. $V_{IH}$ level of input signal

When pulling up the SET, RESET or TRIGGER terminal, pay attention to  $V_{IH}$  level because they have pull-down resistors built in.

## ■ Acceleration Test Mode

The S-8081B has the acceleration test mode to check its F. F. function in a short time. This mode is performed as follows.

- (1) Put SET terminal from low to high level.
- (2) After (1), put RESET terminal from low to high level.
- (3) With keeping (1) and (2) status, input 511 clocks whose levels are the same as  $V_{DD}$  from CR terminal.  
(From 1st to 9th and from 11th to 19th stages of 20-stage F.F. are all high. The 20-stage F.F. starts operation at the falling of input signal.)
- (4) Put RESET terminal low.
- (5) Put SET terminal low.
- (6) Input 514th clock from CR terminal.
- (7) 20th stage of the 20-stage F.F. goes high from low, and the OUT terminal goes low.

**Figure 9**

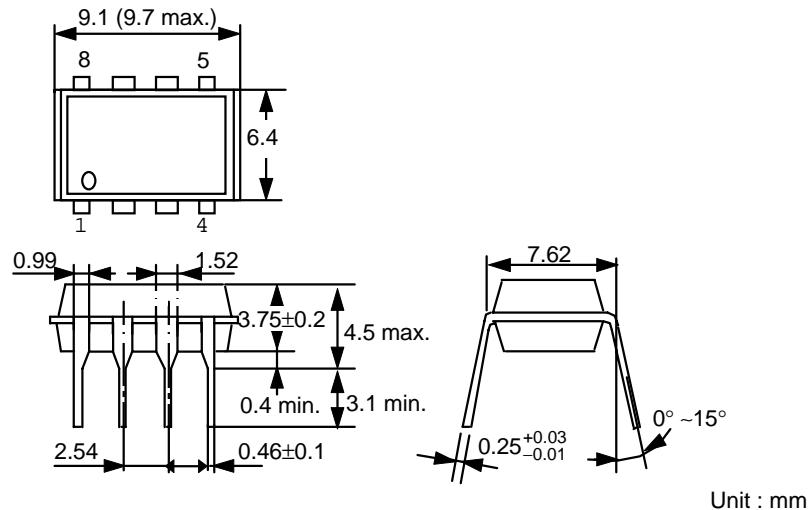

When releasing from acceleration test mode, initialize the S-8081B according to (a) or (b) below.

- (a) Turn the power off, and on again.
- (b) Put RESET terminal high level.

## ■ Characteristics

### 1. Current consumption characteristics

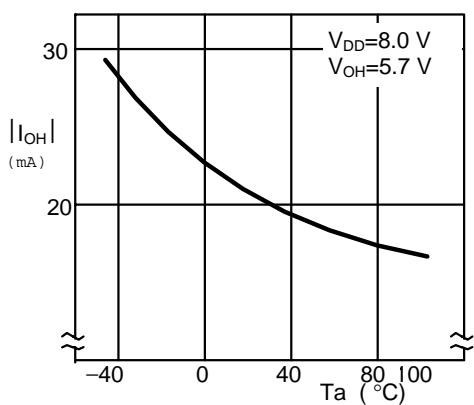

#### 1.1 Operating current consumption $I_{DD}$ - Power supply voltage $V_{DD}$

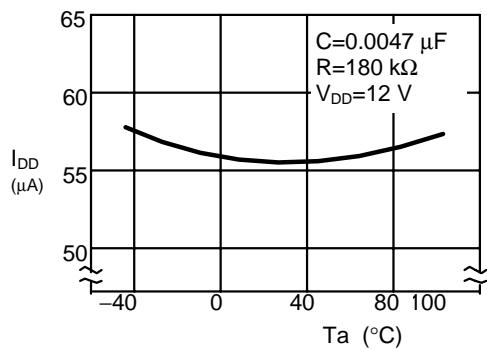

#### 2. Oscillation frequency $\Delta f/f_{osc}$ - Power supply voltage $V_{DD}$

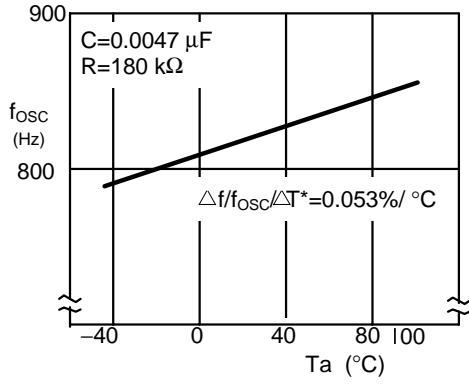

#### 4. High level output current $|I_{OH}|$ - Ambient temperature $T_a$

#### 1.2 Operating current consumption $I_{DD}$ - Ambient temperature $T_a$

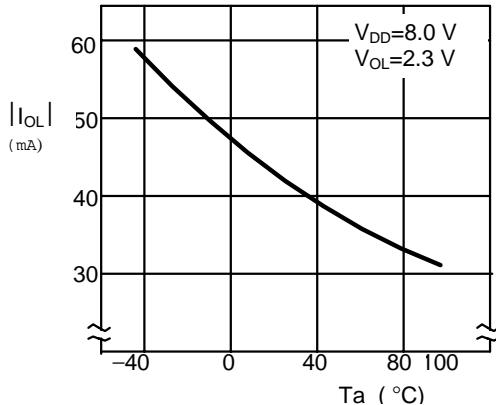

#### 3. Oscillation frequency $f_{osc}$ - Ambient temperature $T_a$

\* $\Delta f/f_{osc}/\Delta T$  is fluctuation of IC only.

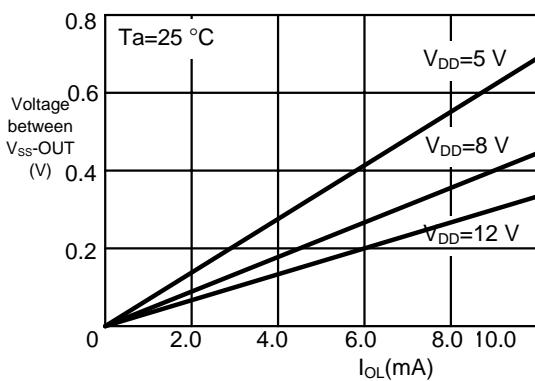

#### 5. Low level output current $|I_{OL}|$ - Ambient temperature $T_a$
