¹⁾ The sensitivity is characterized using 428 nm LEDs as light source. A constant irradiance over the whole lens area is created.

²⁾ The light source used is a 428 nm LED with following characteristics: $t_r > 1 \mu\text{s}$, $t_f < 1 \mu\text{s}$. The output waveform is monitored on an oscilloscope with $t_r > 100 \text{ ns}$, $Z_i = 1 \text{ M}\Omega$, $C_i < 20 \text{ pF}$. The rise time is defined as the time from the 10% to the 90% value, the fall time is defined as the time from the 90% to the 10% value.

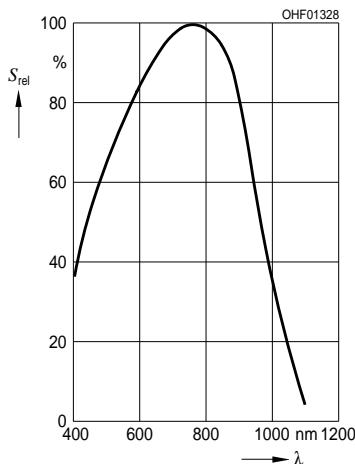

³⁾ PSRR is defined as $20 \log (V_{DD}(f) / V_o(f))$ with $V_{DD}(0 \text{ Hz}) = 4.5 \text{ V}$ and $V_o(0 \text{ Hz}) = 2 \text{ V}$
